(7) The reply of those who support the company system is first that some misapprehension appears to exist on the subject of Government control, the provisions for which as contained in the various contracts with companies appear to them ample. (An extract from the Railway Board's Administration Report for 1914-15 summarising these provisions, is attached for reference.) Secondly, they say, it does not follow that because Government own by far the larger share, they should retain in their own hands the direct management of railways. There appears, it is added, to be no opposition to branch line companies in this country, though these are private concerns, owning and in some cases managing railways, and the objection taken to the administration by companies of the trunk lines of the country may be due therefore, not so much to a dislike of the principle of private enterprise as to their *English domicile*. If so, however, the opposition to main line companies seems to exalt into a governing factor what is a secondary, though no doubt a very important, consideration. Finally, the feature of the existing system to which objection is taken may prove to be temporary. In the past, that is to say, the Boards of companies have necessarily been located in London because practically the whole of the capital of these companies was held in England, but it is urged by those who favour company-management that a change in these conditions will gradually be brought about through a greater proportion of capital being held in this country. If so, the objection will be met by a natural process in the course of time, and it would be a mistake if private enterprise on other grounds to be preferred, to bring all lines under the direct management of the State in order to remove it.

(8) In addition upholders of the existing system claim that it has positive advantages. They say that the present allocation of different parts of the Indian system of railways to semi-independent administrations produces a healthy competition and spirit of emulation which would be lost if all were brought under State-management. They claim that the financial burden of maintaining and extending the whole railway system of India is clearly too great for the Government to bear alone; that the main line companies can give material financial assistance, and that if Government were to buy them out, it would not change the proportion of State and private contributions to the railway property of the country; the State, while increasing its holding in the main lines, would have less to invest in extensions and the result would be merely to shift the field of private enterprise.

(9) Finally, they say that very much the same considerations apply in the matter of administration as of finance. A policy of State-management for all the railways in India would inevitably tend to centralisation; in this respect again the Government would be overburdened, and it would be well advised

according to this view to be content as at present with a general control and for the direct management of railway affairs to retain the services of the companies.

The extract from the Administration Report on the Railways in India for the year 1914-15 referred to in para 7 of the appendix to the Railway Board's letter quoted above is as follows:—

The administrative control exercised by the Government over the Companies is as follows:—

The Company is bound to keep the line in good repair, in good working condition, and fully supplied with rolling stock, plant, and machinery; to keep the rolling stock in good repair and in good working condition; and to maintain a sufficient staff for the purposes of the line;—all to the satisfaction of the Secretary of State.

The Secretary of State may require the Company to carry out any alteration or improvement in the line, or in the working, that he may think necessary for the safety of the public or for the effectual working of the line.

The Secretary of State may require the Company to enter into agreements, on reasonable terms and conditions, with the administrations, of adjoining railways for the exercise of running powers, for the supply to one another, of surplus rolling-stock, for the interchange of traffic and rolling stock and the settlement of through rates, and for additions and alterations to or the redistribution of existing accommodation in junctions or other stations in view to their convenient mutual use.

The train service is to be such as the Secretary of State may require. In order to secure a general control over the rates quoted by Companies the Secretary of State has retained power to settle the classification of goods and to authorise maximum and minimum rates within which the Companies shall be entitled to charge the public for the conveyance of passengers and goods of each class.

The Company has to keep such accounts as the Secretary of State may require, and these are subject to audit by the Secretary of State.

In all other matters relating to the line, the Company is made subject to the supervision and control of the Secretary of State, who may appoint such persons as he may think proper for the purpose of inspecting the line, auditing the accounts or otherwise exercising the power of supervision and control reserved to him. In particular the Secretary of State has the right to appoint a Government Director to the Board of the Company, with a power of veto on all proceedings of the Board. All the moneys received by the Company in respect of the undertaking, whether on capital or revenue account, have to be paid over to the Secretary of State.

All expenditure by the Company has to be stated and submitted for the sanction of the Secretary of State.

It affords us sincere pleasure that the Government of India have at last thought it fit to move in the matter, which is unquestionably a very important one in the interests of the Empire. We are, however, afraid, the views given in the appendix *pro* and *con*, the existing arrangement have been set forth in a manner which is not

likely to be very clear to the ordinary man in the street who is none the less interested in the question of the State *versus* Company Control of our Railways than "the commercial" concerns for whose opinions the Government appears to be so solicitous. The appendix, which we have taken special care to study minutely, though professing to be an impartial document showing both sides of the case for and against State *versus* Company Control of Indian Railways, is far from a fair representation of the case, which is unquestionably one that under the present circumstances the State should, as far as possible, take over the management of the Railways, as opportunities present themselves. Mr. Vijiaraghachariar while moving his Resolution the year before last drew pointed attention to the grave defects of the guarantee system obtaining in this country in the case of not very remunerative railways, the indifference on the part of the Companies to the convenience of the 3rd Class passengers who contribute largely to the earnings of Railways, and various other matters connected with the Railway Administration in this country. Sir Ibrahim Rahimtoollah who had given his staunch support to the previous year's Resolution, but without avail, in moving his own Resolution last year expressed his regret that the State should forego a large share of profits arising from the Railways and relinquish the same in favour of Private Companies who had but little stake—these companies owning about 7 per cent. only of the Capital invested in Railway building in this country—to deserve it and that instead of the Railways being worked direct by the State they should be controlled by Boards of Directors of these Companies living 6,000 miles away from the seat of the operation. We are really sorry that the Railway Board's letter almost wholly ignores these points while giving prominence to matters going in favour of Company-management. The Railway Board appears to us to be anxious to somehow shut out any proper discussion of the contents of the appendix attached to their own letter inasmuch as they state that it is not their intention that the "associations" whose interests are "specially affected" whom the Board have thought fit to consult, should express their views only upon the summary of arguments as given in their letter and the

public bodies consulted by them are not asked or expected anything other than replies to the points specified in the letter in question and while the letter in question devotes more than seven paragraphs to set out the alleged defects of the State-management of Indian Railways and in support of the superiority of the Company-management and in favour of Company-Control, it disposes of rather in a few curt lines all that may be said in favour of the State management. This attitude of the Board, we are constrained to say, appears to be somewhat one-sided, and we feel it, therefore, a duty incumbent upon us to state more fully, or rather repeat what we said a couple of years ago, in these pages the principles which should guide the Government in the matter of the construction and management of the railways in a country like India where the interests not of this or that clique or concern, but the interests and welfare of all should form the main motive of the Administration.

Railway building and railway working are, as we have tried to show in our previous article on the subject referred to above, is clearly among the primary functions of the State, for making and maintaining highways is unquestionably a Governmental duty; and Railways are nothing but the high roads in an improved form which has, in course of time, come into the vogue since George Stephenson's epoch-making invention, with two additions of carrying freight and passengers. The same reasons which render it necessary for the State to make and maintain ordinary roads hold good equally in railway building and railway making. Ruskin is very explicit on the subject. He says:—

Neither the Roads nor the Rail-roads of any nation should belong to any private person. All means of public transit should be provided at public expense by public determination where such means are needed, and the public should be its own 'shareholder.' Neither road, nor railroad, nor canal should ever pay dividends to anybody, they should pay their working expenses and no more. All dividends are simply a tax on the travellers and the goods, levied by the person to whom the road or canal belongs, for the right of passing over his property. And this right should at once be purchased by the nation, and the original cost of the road-way, be it of gravel, iron, adamant, at once defrayed by the nation, and then the whole work of the carriage of persons or goods done for ascertained prices by salaried officers, as the carriage of letters done now.

The principles laid down in the above are unimpeachably sound according to a large majority of modern writers on politi-

cal economy and it is in complete accord with the commonsense point of view, and this is why there is an unmistakable drift towards Government ownership and Nationalisation of Railways in France, Germany, Belgium, Switzerland and other countries in Europe; and in the States of the American Union as well as in Great Britain itself there are signs of the adoption of this principle in no remote future.

But whatever may be the arguments in favour of the continuance of private enterprise in the opening and working of Railways in the self-governing countries of the West, the State-control of their working in India, considering its peculiar political situation, should be the only right policy of railway management in this country where all capital is imported from abroad and all the profits arising from their working find their way abroad. Private enterprise in Railway building in India means employment of European capital.

There is besides another phase of railway management in this country where the existing Railway Companies are all foreign: and if, besides the railways already owned and worked by them all the State lines pass into their hands, they will not only have a lion's share of the profits arising therefrom, the Indian taxpayers for whose benefit and in whose interest the country should primarily be ruled, will not only be deprived of the profits but they will be precluded from holding any appointment in the railway administration. At present a considerable number of Indians find employment in the Superior Ranks on State Railways. In the event of the working of these Railways passing into private hands our countrymen will be deprived of all these appointments. To prove this we have not to go very far. For instance, out of 140 superior appointments on the Eastern Bengal Railway no less than 27 are held by the Indians—12 Engineers, 9 in the State Railway Superior Revenue Establishment in the Traffic Department, 1 in the Medical Department, 5 in the Audit and Accounts Department and 1 in the Store Department. Two holders of these 27 being the heads of very important departments, namely the Engineer-in-Chief, and the Chief Examiner of Accounts. As a contrast to this there is not a single officer of the higher rank employed on the East Indian Railway. The Railway Companies who work for

their own profits and not certainly in the interests of the people are not supposed to see any good in employing the natives of this country in their service, and no one can force them to do so.

They often talk of inefficiency of the Government Departments and we are not unaware of Mr. Herbert Spencer's sneering reference to it in his "Study of Sociology" which is laid so much stress upon by a certain section of the Anglo-Indian press headed by *The Statesman* of this city. Spencer says:—

"The State should purchase the Railways, is confidently asserted by those who every morning read of chaos at the Admiralty, or cross-purposes in the dockyards or diplomatic bungling that endangers peace or frustration of justice by technicalities and costs and delays,—all without having their confidence in officialism shaken."

But does Spencer, or those who are of the same mind with him, go the length of suggesting that for these various "chaos," "cross purposes" and "diplomatic bungling," "frustration of justice," etc., that contracts for working the Navy, the Army, the Diplomatic functions and the Courts of Justice be given to some firms of private enterprise to secure better results? No one claims infallibility for the Government machineries; but whereas these machineries are subject to public criticism and national control, the private syndicates which are run in the interests of the Shareholders are immune from such criticism and such control.

The appendix attached to the Circular-letter issued upon which we make these remarks appears to have put the public in a wrong scent inasmuch as it has not laid stress upon the primary principles of ownership and working of the Railways which should be run in the interests of the Nation. Even if there be any inefficiency in the State Control this may be removed, but to us it appears in bare justice to the people of this country that the Railways should be in the hands of the Government. Surely the Post Office and Telegraphs which are worked direct by the State agency are among the most efficiently managed departments of the State.

The history of the introduction of the Railways in this country may be given in a nut-shell. The railways were first built in India between the year 1850 and 1869 by Companies under contracts with the State which guaranteed to them a fixed interest on

their capital; and they were also given their land free of charge. Under all these contracts the Government reserved the right to purchase the lines at the end of 25 or 50 years. In 1869 the State intervened more directly and undertook the construction of railways by Government officers and for the next ten years all new lines were constructed in this manner. In 1879, however, Companies were again allowed to enter the field and from that year till now the construction of Railways has been carried on, partly by Government and partly by Companies, with capital raised partly by Government and partly through the agency of Companies. A great majority of these railways taken over by the State in terms of the contracts, were, however, leased to the then existing Companies and have continued to be worked by them, except the three lines, the Sind-Punjab and Delhi, which has since developed into the North-Western, the Oudh and Rohilkhand and the Eastern Bengal, are worked directly by the State. The lines which are not owned by Government are the Southern Punjab and the Bengal and North-Western, but of these three the Government holds the right of purchase at certain dates. The actual position then is that Government either owns or can become owners of all the Railways in India; and that of those which it does own, it works three itself, representing about 7,000 miles and has leased the remainder to Companies representing a mileage of some 18,000 miles. But its responsibility does not end here. Under the contract with the Companies the State undertakes to supply the Companies with the requisite capital. The raising of capital by these Companies is also provided for, but the amount so furnished represents relatively a small proportion of the whole. The relationship, thus, between the State and the Companies aforesaid is, in fact, that of a partnership, and this partnership in the interests of the people of India we wish to put an end to.

In the very beginnings of Railway development in this country, in the year 1853, Lord Dalhousie, the then Governor-General of India, recorded a minute embodying this governing principle of the maintenance of control in the hands of the State. He wrote:—

"I heartily trust that the East India Company and the Government of India may hold by the prin-

ple on which they have acted in the present case. I trust they will ever avoid the error of viewing railways merely as private undertakings, and will regard them as national over which the Government may justly exercise, and is called upon to exercise a stringent and salutary control. ... for the interests of the State and for the protection of the public."

And for "the protection of the public"

and in their interests it is high time that all railways leased to Companies should pass into the hands of the State is what we demand in the name of the Indian taxpayers, for reasons set forth in this and in our previous article on the subject.

RAI CHARAN MUKERJEE.

THE KUTASTHAVADA OF SANKARACHARYA

versus

THE AGNOSTICISM OF HERBERT SPENCER

III

VIII. II. SPENCER'S 'FIRST PRINCIPLES' ON THE UNKNOWABLE.

WE should be doing a grave injustice to H. Spencer, if we omit to mention what he said later in life on the 'Unknowable' in his First Principles (I-iv); for, there he seems to have somewhat outgrown his former agnosticism, at least in the sense in which his overzealous followers of to-day understand him. His views as expressed there, almost touch or at least follow close at the heels of those of Sankara. Having noticed the views of Hamilton and Mansel—"The absolute is conceived merely by a negation of conceivability" (Hamilton), "The Absolute and the Infinite are like the *Incôceivable* and the *Imperceptible*, names indicating not an object of thought, or of consciousness at all, but the mere absence of the conditions under which consciousness is possible" (Mansel),—Spencer goes on to say:—

"The answer of pure logic is held to be that by the limits of our intelligence we are rigorously confined within the relative; and that anything transcending the relative can be thought of only as a pure negation, or as a non-existence."

He then proceeds:

"Unavoidable as this conclusion seems, it involves, I think a grave error. The premiss in the form presented is not strictly true. There remains to be stated a qualification which saves us from that scepticism otherwise necessitated. Besides that definite consciousness of which logic formulates the laws, there is also an *indefinite consciousness* which cannot be formulated. To say that we cannot know the Absolute, is by implication to affirm that there is an Absolute. The *Noumenon* everywhere named

as the antithesis of the *Phenomenon* is throughout necessarily thought of as an actuality. The Relative is itself conceivable as such, only by opposition to the Relative or Absolute. The *relativity of knowledge* postulates the *positive existence* of something beyond the relative. If the non-relative or Absolute is present in thought, only as a mere negative, then is the Relative itself unthinkable for want of its antithesis. Whence results the disappearance of all thought whatever. Though philosophy proves to us that *the Absolute is not this, nor that, nor that*—though in obedience to it we negative one after another each idea as it arises, yet, there ever remains behind an element which passes into new shapes. The continual negation of each particular form and limit simply results in the more or less complete abstraction of all forms and limits; and so ends in an *indefinite consciousness of the unformed and unlimited*."

He goes on to say:

"An ever-present sense of real existence is the very basis of our intelligence. By the laws of thought we are rigorously prevented from forming a conception of absolute existence; we are by the laws of thought equally prevented from ridding ourselves of the consciousness of absolute existence,—this consciousness being the obverse of our self-consciousness. And since the only possible measure of relative validity among our beliefs, is the degree of their persistence in opposition to the efforts made to change them, it follows that this which persists at all times, under all circumstances, and cannot cease until consciousness ceases, has the *highest validity of any*." (II—iv.)

IX. COMPARISON.

You see how closely, and yet knowing nothing about *Sankara*, Spencer follows him. *Sankara* following his master, the great seer *Yagnavalkya*, speaks of *Brahma* as "सत्यस्य सत्य"—the Essence of Essences—"सत् सत्यस्य सत्यं तदेवावशिष्यते।" Spencer almost paraphrasing that expression,—says that "the Absolute has the highest validity of

any." Commenting on Yagnavalkya's description of Brahma by negatives :—"अखल-मनः" &c., Sankara says that it means that the "अक्षरब्रह्म" is "सर्व-विशेषणरहितं," or what is elsewhere called "नेति नेति"—'अथ अत्र आदेशो नेति-नेति' or not this, not that. (P. 433). Says Sankara—"ननु कथं नेति नेतीति शब्दाभ्यां सत्यस्य सत्त्वं निर्दिष्टं"—"How, by the words 'not this, not that,' is it intended to explain the सत्यस्य सत्त्वं or the Truest of the true? By the elimination of all particularity due to separable accidents (सर्वोपाधिविशेषापादेन)." Spencer may almost be said to translate literally the Vedantic 'नेति नेति'—when he says that "the Absolute is not this, nor that, nor that." Not having received the necessary training in निदिध्यासन or Self-isolation and Self-realization, Spencer could not indeed realize that the Absolute is Prajnana-Ghana, or Vijnana-Ghana, or Self-consciousness—pure and undiluted,—“इदं महद्भूतं अनन्तं अगारं विज्ञानघन एव” (p. 462)—which Sankara thus explains :—"This is that mighty Being called *Paramatma* from whom by *Avidya* you are defined and limited off, because of your connection with the accidents of effects and instruments, and thus individualised, you are also thereby made liable to death, and all the ills of life. That individual form is seated deep in the *Paramatma* which stands to it in the relation of a great ocean (to a drop of water), and which is pure, and of one kind of taste like a lump of salt, which is Consciousness pure and unmixed."* It must be said to the credit of H. Spencer that without the exercise of the Vedantic Self-isolation and Self-realization "निदिध्यासन,"—he has been able to discover that besides that definite consciousness of which logic formulates the laws, there is also an indefinite consciousness which cannot be formulated; and that he should be able to teach almost in the

style of the Vedantic seers of old that the continual negation of each particular form and limit, simply results in the more or less complete abstraction of all forms and limits, and so ends in an indefinite consciousness of the unformed and unlimited." His idea of the Absolute as "an indefinite consciousness of the unformed and unlimited"—indeed falls far short of Yagnavalkya's "विज्ञानघन", or of Sankara's "कूटस्थनित्यात्मजोतिः". Be that as it may, for a mere philosopher like Spencer to have apprehended so much was indeed a marvellous achievement. The "सच्चिदानन्दघन" of the Vedanta,—he could realise as 'सत्त्वन', or as "having the highest validity of any." He could almost touch the 'ब्रह्मन,' as an "indefinite consciousness of the formless and unlimited." The "आनन्दघन", the 'All-blissful' he could not be expected to realise without the necessary progress in that Self-realization called निदिध्यासन or Samadhi. It was only in their Samadhi or "Vision Beatific" that our *rishis* themselves could realise that "All things come from that Blissful, in that Blissful they live, into that Blissful they pass away, and disappear,—“आनन्दाद्देव खल्विमानि भूतानि जायन्ते । आनन्देन जातानि जीवन्ति ॥ आनन्दं प्रयत्याभिसंविशन्ति ।”

Notice Spencer's expression "unclassable and therefore unknowable," by which he identifies knowing with classifying. If that be all, if the Absolute or the substance of mind be said to be unknowable merely in the sense that it is unclassable, Sankara would unhesitatingly say 'Ditto to Spencer.' The Absolute or कूटस्थ, according to Sankara too, is inaccessible to the "लौकिको दृष्टिः" or the phenomenal seeing connected with the eye (बहुःसंयुक्तान्तःकरणवृत्तिः), to which alone, definition, classification, and generalization refer. Sankara would even fully endorse Hamilton's proposition so far as this लौकिकोदृष्टिः or phenomenal seeing is concerned :—"The absolute is conceived merely by a negation of conceivability"—and would fully support the doctrine of the Relativity of all knowledge, so far as that लौकिको दृष्टिः is concerned, for in his उपदेशसाहस्री Sankara says :—“प्रदृष्टं द्रष्टृविज्ञातं दम्भमित्यादिशासनात् । नैव

* “इदं परमात्मस्थं महद्भूतं यस्मात् अविशया परि-
क्लिप्ता सती कार्य-करणोपाधिरन्वयात् मित्रा-पातमापन्नानि,
सत्ता संसारधर्मवती अभि, स खल्विभावः महासमुद्रस्यानीये
परमात्मनि शुद्धे मैत्र्यवचनात् एकरमे प्रज्ञानघने प्रवेशितः ।
घन शब्दो जात्यन्तरप्रतिषेधार्थः । नात्यन्तं जात्यन्तरं अन्तराले
विद्यते” ।

ज्ञेयं मया ध्यातुं परं ब्रह्म कथञ्चन"—(२९) - 'The seer who is not seen,' 'the knower who is not known,' and "thou little knowest the nature of Brahma if thou thinkest that thou knowest well"—यदि मन्यते सुतदिति दम्भेन विननं त्वं तस्य ब्रह्मणो रूपं,—from these teachings it follows that *Parabrahma* cannot be said to be the *Jneya* or object known either by myself or by anybody else, meaning of course so far as the *लौकिको दृष्टिः* goes. In that sense and in that sense only *Sankara* would have nothing to object to the agnostic position. But that would not be really true or the whole truth, for *Sankara's Kutastha Self* is a *Nityatmajyotih*—or an everknown light of Self-consciousness, and immediately and directly perceived—(साक्षात् अपेराक्षात्). Says *Sankara* :—
 "स्वरूपाव्यवधानाभ्यां ज्ञानालोकस्वभावतः । अन्यज्ञानानपेक्षत्वात् ज्ञातं ब्रह्म सदा मया ॥" "Being my own essence, there being nothing else intervening between me and Brahma, being of the very nature of a self-luminous Consciousness, and not depending for the proof of its existence on any other knowledge, Brahma is always known to me"—of course implicitly, and that knowledge has to be made explicit *Sadhana* or training.

I should also note here that what *Sankara* calls the *Kutasthanityatma-Jyotih*, is also the Personal or better still, the Super-personal Ruler within all,—"*Antaryami Purushah*," or if Emerson's expression should be preferred, the "Over-soul" in all ("परमात्मा सर्वान्तरः"), but not indeed, what some Neo-Hegelians would call, "a colony of selves"—resembling a "foot-ball team." Says *Sankara* in the *Antaryami Vidya-Bhashya* :—"Under the rule of this *Akshara* or Indestructible One, who pervades all, under the rule of this Brahma immediately related to us and not remote from us, the Self in all (*Sarvantarah*),—just as under the rule of the king, his kingdom suffers no harm, but goes on as usual, so also under the rule of this *Akshara Brahma*,—the sun and moon like lamps adapted for the world for day and for night, and designed and made according to His design by that Great Ruler, for that very purpose, with the full knowledge of the services they would render to the

worlds,—stand well-supported." * (*Jivanda*, p. 629).

X. THE TRINITY.

Sankara, I should add, even goes so far as to evolve an apparent, though not real,† Trinity or 'Three in One and One in Three out of that One (अक्षर) Brahma or *Kutasthanityatma jyotih* :—यमन्तर्धामिनं न विदुः, ये च न विदुः, यच्च तदक्षरं दर्शनादिक्रिया-कर्तृत्वेन सर्व्वेषां चेतनाधातुः" (p. 627);—(1) "The Ruler within all, or *Isvara*, whom His creatures do not know or the *Superpersonal* Relative Self, or God, commonly called *Saguna Brahma*; (2) the *Kshetrajna*, or subordinate self of the creature who does not know that Ruler within, or the *personal* relative self of the creature, commonly called *Jiva*, and (3) that changeless One (अक्षर) who as the Active agent in all actions—such as seeing, etc., stands as the Conscious Substratum underlying all, or the Impersonal Absolute Self or Brahma, commonly called *Nirguna Brahma*." The Trinity thus propounded by *Sankara* might well bear comparison with the Hegelian Trinity or the common Christian Trinity of (1) the Father or the absolute eternal Idea or God before creation, (2) the Son or Being-for-other,—Nature and Spirit, and (3) the Holy Spirit which brings about the unity of the Father and the Son. What *Sankaracharya* calls "the Self-conscious Substratum of all"—"*Sarvesam chetana-dhatuh*," and "described as 'not this' 'not that,' being the One without particularity"—"*nirviseshatvat-ekatvat cha neti neti Vyapadesobhava*ti," i.e., the impersonal Brahma, corresponds, to what Hegel calls the Father—"the absolute, eternal Idea in its essential existence, in-and-for-itself, God in His eternity before the creation of the world, and outside of the world." (With this compare the *Purushasukta* "त्रिपादस्यामृतं दिवि" "Three-fourths of whom is the eternal in Heaven"). What *Sankara* calls *Kshetrajna* or *Jiva*, the sub-

* यदेतदधिगतं अक्षरं सर्व्वान्तरं साक्षादपरोक्षात् ब्रह्म, एतस्य वै अक्षरस्य प्रभासने यथा राजःप्रभासने राज्ञः अस्फुटितं नियतं वर्तते एवं, एतस्य प्रभासने सूर्य्याचन्द्रमसौ अक्षो रात्रयोः लोकप्रदीपौ, तादस्योऽन, प्रभासिषा ताभ्यां निर्व्वर्त्यमाने लोकप्रयोजनविज्ञानवतां निश्चितौ, विष्टौ स्यातां ।

† 'भेद एषां प्रउपाधिकृतः, न खत एषां भेदोऽभेदो वा सैव्यवचनवत् प्रज्ञान चनेकरस साभाष्यात् ।' (P. 638).

ordinate creature-self having the particular forms of effects and instruments relating to individual desires and acts, and all due to *avidya*,"* would correspond to what Hegel calls "the Son" or 'the Other,' or 'Being-for-another' in "the form of manifestation or appearance." "What is thus differentiated is Nature, the world in general and spirit." Christ according to Hegel is Sonship *explicit*, the Notion, or the Son as he ought to be. In all other men Sonship is *implicit*, and has to be made explicit by training. What Sankara calls the "The Ruler within"—"*nityaniratisaya Jnanasaktyupadhiratmantaryamisvarah*"—"God, the Ruler within, having eternally infinite intelligence and power, as His attributes" (p. 639),—"Svena svabhavenaksharam para uchvate,"—"Who in His own nature is called the Unchangeable and Supreme"—"*tatha Hiranyagarbhavyakritadevata bhavati*"—"Who likewise also becomes the Hiranyagarbha, or the golden germ) the presiding god of the world-germ,"—would also seem to correspond to Hegel's conception of the Holy Spirit; for says Hegel "God thought of simply as the Father is not yet the True." "God eternally begets His Son, distinguishes Himself from Himself, and being in the other, He is simply with Himself, and this is the form of love. This love is spirit, the Holy Spirit." "Spirit is infinite return into Self, infinite subjectivity, not Godhead conceived of in ideas, but the real present Godhead, and thus it is not the substantial potentiality of the Father, not the True in the objective or antithetical form of the Son, but the subjective Present and Real. This is the Spirit of God, or God as present real spirit, God dwelling in His Church." (Phil. Rel. V. iii, p. 107).

It should be remembered that Hegel was not altogether unenlightened with regard to the Indian religion,—though it would have been better for the latter if he were,—for his enlightenment gave him just light enough "to make darkness visible." Apart from the striking family-likeness between Hegel's Trinity, and what he calls our "*Trimurti*," Hegel himself observes: "The most striking and the greatest feature in Indian mythology is unquestionably this Trinity in Unity." (Phil. Rel. V. ii. p. 14). From this one is inclined to presume that

in propounding his dialectic method, and his Subjective Idealism, Hegel must have taken the hint from the Vedantic *Sarvamavada*—or Self-in-all, in whatever crude form it may have reached him in his day.

X. AVIDYA AND THE RELATIVITY OF ALL KNOWLEDGE.

I have placed before you the case for Sankara's Kutasthavada, as well as that for Spencer's Agnosticism; and would leave you to decide whether you would not consider it childish to call the Absolute as "unknown and unknowable," and thus shelve away, the problem of problems of life, burying the eyes, as it were, ostrich-like in the sands of Relativity, and to console yourself with saying, you 'cannot know,' what your whole human nature impels you, even whips you on to seek and know. Now a word about this Relatively and its connection with the vedantic *Avidya*. II. Spencer refers to 'the Relativity of knowledge' of Hamilton and Mansel, by which they try to prove that "by the limits of our intelligence we are rigorously confined within the relative; and that anything transcending the relative can be thought of only as a pure negative, or as non-existence." In the course of this discourse I have also had to speak of the *avidya* of the vedantic philosophers of the schools of Sankara or Ramanuja:—"अविद्या परिच्छिन्ना सती"—"Defined and determined off by *avidya*." What is this *avidya*? What is its relation to "the Relativity of all knowledge" of Hamilton?

Briefly speaking by *avidya* is meant the losing sight of the Absolute in our natural craving for the Relative. Hegel may be said almost to describe the Vedantic *avidya* when he says: "The true knowledge of God begins when we know that things, as they immediately are, have no truth." (Logic—112). I will however present you with my translation of a part of Sankara's preface to his Sutrashashya in which Sankara himself explains in detail what is meant by *Avidya*:—"The object or *विषय* represented by the perception of the not-self, and the subject or *विषयी* represented by the perception of Self are by their very nature opposed to each other as darkness is opposed to light." I should notice here that Spencer almost reproduces

* "अविद्याकायकर्मविशिष्टकार्यकरणोपाधिरात्मा संसारो जौव उच्यते" (Jiva, p. 639).

this conclusion of Sankara, when he says :— "In brief a thing cannot at the same instant be both subject and object of thought." Then Sankara goes on :—"It is quite apparent that the subject cannot be the object, or *vice versa*, the object cannot be the subject, and necessarily the properties of the one cannot be the properties of the other. From this it follows that to see the subject (विषयौ) which is all-consciousness, and apprehended only by the perception of Self,—to see that subject as the object which is (unconscious and) apprehended by the perception of not-self, and to ascribe the properties of the subject to the object, or likewise to reverse the process, and see the (unconscious) object as the all-conscious subject, and to see the properties of the object in the subject, ought to be regarded as an *illusion*. And it is from such seeing of the one in the other, and seeing the properties of the one in the other,—without discriminating the one from the other, although the two entities as well as their properties are quite different from each other,—there results an illusory perception in which truth and untruth unite in wedlock as it were, and produce, as their offspring, the natural course of practical life,—as saying 'I am this,' 'this is mine' etc. What is this confounding of the one with the other (अध्यास) ? It is of the nature of an act of memory, being an act of seeing in what follows, that which was seen before it (कृतिरूपः परम पूर्वदृष्टावभासः)." You will thus see the connection of the Vedantic *Adhyasa*, which is but another name for *avidya*, with what has been called by Mill and others as "the Association of ideas." Sankara goes on :—"How is it possible to see the properties of the object of perception to be those of the all-penetrating Self (प्रत्यगात्मा), when that Self cannot be an object of perception (अविषये) ? Do you mean that the all-perceiving subject though it cannot be perceived as a 'you'—(युष्मत्प्रत्ययापेक्षया), it can still be an object of perception ? I will tell you. Considering the question more deeply, the all-penetrating Self (प्रत्यगात्मा) is not altogether not an object (अविषय) of perception, for it is the object of perception of Self. Being also immediately perceived, it is quite apparent to all as the perceiving Self of all (प्रत्यगात्मप्रसिद्धेः). This *Adhyasa* or illusion of subject and object (विष-विषयौ) as describ-

ed above, is what the learned understand by *avidya*. "त मेतं एवंलक्षणं अध्यासं परिहृता अविद्या इति मन्यन्ते" By the clear discrimination of the one from the other, to know the reality as it is, is *vidya*—"तद्विकेन च वस्तु-स्वरूपावधारणं विद्यामाहुः।"

Now to show the full scope of *avidya*—as covering the whole field of practical life, or what is implied by Hamilton's doctrine of 'the Relativity of all knowledge'—Sankara says that "all the uses of the terms,— 'proof' and 'thing to be proved'—in practical life—"सर्वे प्रमाण-प्रमेय-व्यवहारा लोकिनाः" have reference to this intermingling by illusory association of self and not-self called *avidya*—"तमेतमविद्याख्य मात्मानात्मनो रितरेतराध्यासं परमकृत्य सर्वं प्रमाण-प्रमेय-व्यवहाराः प्रवृत्ताः"। "How do the proofs, such as knowing by direct perception and the rest,—प्रत्यक्षादीनि प्रमाणानि—relate to persons subject to *avidya* (अविद्यावद्विषयानि) ? I will tell you: So long as one does not feel with reference to his body and organs &c., that it is me, or that it is mine, one is not in a position to be a knower of anything through the body and the organs,—for in reference to such a one the very desire for such kind of proof is out of place, "प्रमाणप्रवृत्त्यनुपपत्तेः"। So long as the organs of sense are not included in one's Self,—as being one's own, the use of sensuous perception can not take place. The organs of sense too on the other hand are not in a position to perform their functions unless they have a Self to them for their support. What is true for the organs, is true for the body also;—one can not be said to do anything with the body, unless and until he has connected with the body the idea of Self. The Self too which is by nature free from the bonds of the unreal (*i.e.*, the phenomenal world), can not also in that case be said to be a knower in relation to all this (*i.e.* the phenomenal world). The very desire for (sensuous) proof is not possible, unless there is a knower (connected with the senses). It thus follows as a necessary corollary, that the uses of sensuous perception, and such other means of right knowing, all relate to the objects of *avidya*." This is but another form of stating the proposition of "the Relativity of all knowledge."

Sankara draws the same inference by pointing out the similarity between men's uses of their sensuous perceptions and inferences, and those of the beasts, which are admittedly subject to *avidya*. Says Sankara: "The above conclusion (regarding the connection between *avidya* (or अविवेक), and men's use of sensuous perceptions and inferences (प्रमाण-प्रमेय-व्यवहारः) also follows from the fact that there is no difference between men and brutes in this respect. Beasts etc., when their ears, etc., come into relation with sound, etc., and they perceive a hostile sound etc., fly from them. On the other hand when they perceive a sound, etc., favourable to them, they turn towards them. For example, when they see a man with a raised stick approach, they think 'he wishes to kill me,' and begin to fly. When they see another man with hands full of green grass advance, they turn towards him. Just in the same way men, —even men of a well-developed understanding, when they see strong fierce-looking men approach with uplifted sword, threatening aloud,—retreat from them; and when they see those of an opposite description approach, turn towards them. It follows then that as regards the use of proof and things to be proved (प्रमाण-प्रमेय-व्यवहारः),—the position of men is similar to that of the brutes. In the case of the brutes, the use of sensuous proof and things to be proved, is well-known to have, for an "invariable and unconditional antecedent" their want of discrimination (अविवेक). The inference necessarily follows from this general rule, that men's use of sensuous proof, and things to be proved,—even of men of a well-developed understanding, also follows as a necessary consequence of, and is co-extensive with their want of discrimination:—"अतः समानः पश्यादिभिः पुरुषाणां प्रमाण-प्रमेय-व्यवहारः । पश्यादीनाञ्च प्रसिद्ध एव अविवेकपूर्वकः प्रत्यक्षादिव्यवहारः तत्सामान्यदर्शनात् । वातपक्षिमतमपि पुरुषाणां प्रत्यक्षादिव्यवहारः तत्काण्डसमानः इति निश्चीयते ।" It was Schlegel who said:—"Nature sleeps in the plant, dreams in the animal, and wakes in man." The Vedantic *avidya*, *adhyasa*, or *aviveka* or—whatever else it is called, seems also to carry with it something like the idea of a sleep or trance — (बीज-निद्रा). If the state of the brute could be called a "dream", —that of the common unawakened man is no

better:—as Raja Rammohan Ray sang "महामाया निद्रावशे देखिह स्वप्न." This charm-like soporific effect of *Avidya* not only makes one to forget the "प्रज्ञान-चन", or "all-conscious" nature of the Self, which Yajñavalkya took so much pains to impress upon his wife, and not only leads the Self to attach to and associate with the ever-changing "कार्यकरणसङ्घातः," sum or lump of effects and instruments, e.g., the body and the organs, but leads also to the creation of an altogether false or empirical Self, which Sankara thus describes:—"We have said that *Adhyasa* is the perceiving of a thing to be what it is not,—"*अतस्मिंस्तद्विद्मः*". By way of *Adhyasa* when people see their wives and children maimed or whole of limb, they feel as though they themselves were maimed or whole of limb, thus seeing in the Self the qualities of things external to it. Likewise also they see the qualities of the body in the Self, when they say, 'I am fat or lean,' or 'I stand or go, or jump.' In the same way they see in the Self the qualities of the organs (sensory or motor), when they say 'I am dumb, unsexed, deaf, one-eyed, or blind.' Similarly also they see in the Self the qualities of the internal organs (अन्तःकरण),—such as desire or will, doubt or determination. In this way they see an individual perceiver of the Self (अहम्स्वयं) in the Seer of all wherever the individual self shows itself (अशेषस्य प्रचारसाक्षिणि) in the Self that penetrates all (प्रत्यगात्मनि). Likewise also by reversing the process, they see that Universal (प्रत्यगात्मानं) and All-seeing Self (सर्वसाक्षिणं) in the internal organs, &c. Such then is the nature of that *Adhyasa* inherent in all things (नैसर्गिकः), without beginning, without end, having the form of an illusory perception (मिथ्याप्रत्ययरूपः) which is apparent to all (सर्वत्रात्मप्रत्ययः), as prompting their determination to do and to suffer (कर्तृत्व-भोक्तृत्वप्रवर्तकः). I may myself add here that that this illusion called *Adhyasa* or *Avidya* may show itself in a mistaken identification of the प्रज्ञान-चन or All-conscious Self with the most trivial of things. Think how in a game of whist even when played for love and not for money, the unexpected trumping of an important card upsets the young player who loses, or

fills with joy the young player who wins. My little son was once playing the game called *Dak*, and happened to forfeit all his trumps. O, how it cut him to the quick. He began to beat his brow, and almost went mad, as if he had lost a son, or a Zemindari,—till a slap on the cheek from his mother, roused him from that hysterical fit of *avidya*. Indeed you might look upon Hume's doctrine that “we know only mental states,” or that “we are ourselves but the particularized sums of mental states,” or upon Hamilton's “of the Relativity of all knowledge” that “our mental states are ours only, or have reality only in relation to ourselves,”—or for the matter of that upon the agnostic position itself as glaring instances of the bewitching effect of what Sankara calls *avidya*. This *avidya* you will also see, while including all that can be covered by those doctrines of Hume, Hamilton, or Spencer, goes much deeper, in as much as it also reveals their common blunder, called in the Vedanta the illusion “of the tenth” (दशम त्वायेन),—that of excluding from the calculation the knowledge of the all-seeing Self, the self-conscious substance of Mind, or the Absolute subject, the knowledge of which, as Sankara has shewn, underlies, though *implicitly* all particular knowledge whatever. That implicit knowledge can always be made *explicit* by training, or *sadhana*. Spencer's agnosticism only reduces the position of Hume and his school to an absurdity. With Sankara on the other hand though *avidya* is the illusion of subjectivizing the object as much as the objectivizing of the subject,—neither the subject nor the object is like the X of an insoluble equation, as Spencer puts it, for the subject is always known immediately, as well as directly (साक्षात् अपरोक्षात्), and the object known at times when associated with a mental state connected with the eye (चक्षुःसंयुक्तान्तःकरणवृत्तिः). Lastly I should also note here that Sankara's *Adhyasa* or, *Avidya* is the antinomy of *apavada*, *Vidya*, or *Vireka* i.e., discrimination of the subject and its attributes, from the object and its attributes, so as to prevent their merging together, and thus to rectify the blunder of our hedonistic practical life, which we share in common with the brutes, by the

cultivation of *Vidya** or the making explicit by the proper exercise of reasoning (मनन), and of deep meditation (निदिध्यासन), that perception of one-ness of the Self or सत्त्वात्मभावः— which exists inherent though implicit in all men, and distinguishes the man from his brother, the brute. Thus Sankara's *avidya* and *vidya* both based upon unimpeachable facts of self-observation, self-analysis, and experience, might be taken as the Vedantic contribution to Kant's list of the “antinomies of cosmology” which might help to reconcile the irreconcilable in his ‘Practical Reason’, and his ‘Pure Reason.’

XI. THE CONCLUSION.

Now a word of explanation. Why, do you think, I selected this rather abstruse subject to tire your patience with? My sole object is to create in you an interest in the study of India's philosophy, by showing how much deeper it is than the deepest of the systems of European philosophy. As Indians, we owe a duty to the world, to ourselves,—and above all to our Pitri-loka, a duty that none can discharge so well as we can. We are the natural custodians of the treasured wisdom of our ancestors, and it is a sacred duty that we owe to God, and to our ancestors, to transmit it to the world in all its original vigor and purity. The world to-day stands badly—very badly indeed,—in need of it. The hollowness of a mere egoistic or hedonistic civilization is now apparent to all. Now, more than ever, does the world look up with hope to the treasured wisdom of our *rishis* or seers for an *altruistic* civilization, either based on the self-renunciation of the great Buddha and his immediate successors, or to a civilization

* Compare the Yoga-Vasishtha:

“अविद्या, सम्परिज्ञातं, इदमेव सद्योषधं ।

अविद्यावित्तनयापेक्षिभिरस्यैव दीपकं ॥ १२ ॥

अविद्या सम्परिज्ञाना यदैव हि तदैव हि ।

सा परिच्छीयो भूयः स्वप्ने नैनवहि भोगम् ॥ १३ ॥

उपशम—६४ ॥

“Perception of the *Jagat* or objective world as different from the Self, is a diseased vision due to *avidya* alone, and thus fully understood is the sovereign remedy for the disease of *Avidya*, spread far and wide, even as the lamp is the remedy in regard to darkness. No sooner is this *avidya* fully understood, she dies away, even as the enjoyments of a dream die away as soon as it is realised to be a dream.”

based on the ideal of "One-Self in all"—**सर्वान्मात्रः**—of the Vedānta, as championed by Sankara, which was, and is, and ever will be the true "salt of the earth,"—which you hold in trust as the only key for the realization of the dream of ages,—of the "coming of the Kingdom of Heaven," or "the return of the Golden age," or "of the Satya Yuga",—which in some form or other has warmed the hearts of men in all countries, and times.

Are you not aware that the late Prof. Max Müller gave our nation the greatest compliment, when he called us "a nation of philosophers?" I had the rare honour of knowing the late Professor personally. He was not a man to indulge in hollow compliments. Where then is our philosophy gone now? Has she fallen under the curse of Kumbhakarna and gone to sleep? Worse still, like Rip Van Winkle of the western fable, will she sleep on without a break for a whole cycle of years? Shall we not rather do all we can to wake her up now from that death-like sleep, when a groaning world invokes her help, and set her about her Divine mission,—the redemption of a brutal humanity? Do you need to be shewn how backward we Indians are today in philosophical studies and researches? Do you need to be told that the very best of us are but doing the "चिष्टवेष्टन,"—or as they say, "chewing the cud" of the ill-drawn and ill-digested conclusions and generalizations of a Mill or Spencer, or of a Kant or Hegel? Do you need to be shewn that the very best of us are but wasting their God-given energies, like Samson in the service of the Philistines, in gathering only the aftermath of European systems of philosophy, in barren criticisms merely for students' examination-purposes,—panting after the good luck of a European fame even "as the hart panteth after the water-brooks." Physical and chemical studies and researches require a free access to well-equipped and expensive laboratories, which in our present condition is not easy to get even for the best Indian D. Sc's of the London University,—and yet India has produced a physicist and a chemist to whom physicists and chemists now look up for new light. But where shall we look for a worthy representative of India's philosophy,—a worthy representative of this nation of philosophers? And yet it is philosophy which least of all requires the fitting up of expensive labora-

tories,—for which every man is for himself a living laboratory for research-work. Raja Rammohan Ray was the first among us moderns—to revive the study of Sankara's philosophy. But, alas, after him the flower of our youth have been fruitlessly grinding at philosophizing, without as yet producing any tangible result. Do you know, why? Have you ever tried to discover the cause, why this "nation of philosophers" should stand to-day without a single true philosopher, worthy to be named by the side of Spencer or Kant, Hume or Hegel? Let me tell you, why it has been so, why it must be so, unless our present methods are radically improved.

'Mere imitation,' as Emerson has said, 'is suicide of the soul'—as much for a nation as for an individual,—and nowhere is its suicidal effect more marked than in the domain of India's original research in philosophy. Nations like individuals have special aptitudes,—or, what they call, genius. The aping methods and lessons by rote in philosophical study, under which our students have been brought up for the last half of a century or longer, has dealt a sort of death blow to the philosophical genius of our nation. What might have been a great source of strength to a healthy growing intellect, by opening new vistas of thought, has been our bane. If our young men are well grounded at least by a course of training in the vernacular, —in our own six systems of philosophy, before they are called upon to wrestle with the philosophical genius of Europe, it would, like Jacob's wrestling with the angel, secure a valuable accession of strength to their growing intellects. As it is, they are made to go—unfledged and raw,—a-begging for light, to a class of "blind leaders of the blind" of the West, who have converted the very name of Hegel, —who more than any other, closely approaches our Vedantic ideal in philosophy, and who may be said to occupy a rung of the Vedantic ladder of 'One Self in all' (**सर्वान्मात्रः**)—into a sort of Tower of Babel, justifying the complaint of Wallace that the so-called "interpreters of the Hegelian philosophy have contradicted each other almost as variously as the several commentators of the Bible." It is much to be deplored that those of us who dabble in Hegelian philosophy, instead of trying to illuminate its dark places by directing on it

the search-light of the Vedanta, do but swell the chorus of that confusion of tongues of Hegel's so-called disciples, and "find no end, in wandering mazes lost."

As a people we are born and brought up in systems of philosophy not inferior to any now in command of the world's market,—which we sucked almost with our mother's milk, the light of which flows into us almost as readily as the running down of water. These our indigenous systems of philosophy—the Vedanta, the Sankhya, or the Nyaya, or the Buddhistic, —Madhyamika, Yogachara, Baibhashika, and Sautrantika (of which we now know little more than the mere names), must be revived, by the infusion of new blood,—either by the light of new truths, or of new methods of investigation,—if they are to live,—and not remain, as they do now, the mere mummies of long dead systems of philosophy; they must be made to recover their old vigor so as to be fit to serve as the stock on which the philosophies of a Spencer or Kant may be safely grafted, to the advantage of both the stock and the graft.

All true growth is organic or by assimilation from within outwards. Our indigenous systems of philosophy,—like the Vedanta, or Sankhya, are organic growths from within us. If any foreign system of philosophy is to obtain a footing among us, and do anything more profitable than merely earn bread for our hungry stomachs, they must, like all exotic plants in the hands of the skilful gardener, be carefully and judiciously grafted on to one of our old indigenous stocks,—Vedanta, Sankhya, or Nyaya, so that a living organic union of parts may take place, as much for the benefit of the stock, as

for that of the graft, much like the union that has taken place between the Greek and Indian astronomies. Through succeeding generations of neglect, the thread of life of our systems of philosophy have almost been snapped asunder, so that they are fast losing vitality, and their pulse is fast sinking. Through hard and toilsome study on the part of our youth alone can that thread be fully restored and reinvigorated, and their organic powers of digestion, assimilation, and ejection of excreta, be stimulated. Instead of placing the cart before the horse, and thereby wasting the energies of our youth in the abnormal course of first mastering alien philosophies, we should follow the normal course of nature by first serving to them, at least as a vernacular course in philosophy,—our indigenous systems—as the staple food—the Dal-Bhat—to their raw growing intellects, and on their attaining maturity, serve to them the *Pulao* and *Korma* of foreign philosophy, having recourse to such laboratory methods for appetising sauces, or as stomachic condiments and *chutnies*, as our modern psycho-physiology, or psycho-physics will permit. To reverse that normal course is to kill true philosophic life in our nation. Restore that normal course of healthy growth, and you shall have among us, at no distant date, the suitable soil and conditions for the growth of genuine philosophy, and shall produce genuine philosophers fit to rub shoulders with a Spencer or Kant, a Hume or Hegel,—stalwart champions worthy to stand up before the world as the representatives of a "nation of philosophers."

(Concluded.)

DVIJADAS DATTA.

THE WIFE OF HIS YOUTH

BY LILIAN TWIGG, AUTHOR OF "OUT OF FOCUS," "THE MIRACLE," "TO-MORROW," &c.

[All Rights Reserved.]

"A good man wasted. In the hands of a nice woman there's no knowing what John Andrews might have risen to. As it is, he's just where his father left him, and that's the price he's paid for being a bachelor."

The rich woman who spoke gathered her furs about her and stepped into the latest model of luxurious landaulettes, followed by a deferential companion; while the poor woman who listened lingered shivering on the pavement.

"She's not right," murmured the poor woman. "A man with that mouth would never have risen to big things. Perhaps she didn't know him when he was clean shaven. I've not had her advantages, but I had sense enough to advise him to grow a moustache."

The February blizzard, with its choking dust, caught the speaker in its grip, and her frail figure shook with a hacking cough.

"These winds will carry me off, Jacky," she said aloud to the little lad at her side, and he manfully tried to place himself between her and the bitter wind, clinging tightly to her skirt as if he thought she would be literally swept away.

For half an hour she had been walking up and down the street irresolutely, pausing each time she passed a massive, dignified door on which was a brass plate bearing the inscription, "John Andrews, Solicitor."

Suddenly, summoning all her courage, she grasped the child by the hand and, boldly entering, ascended the broad staircase. She tapped bravely on the door at the head of the stairs. Unfortunately it was opened by an old confidential clerk, who, recognising her, hesitated, but when she said with an authority she had never asserted before, "I must see Mr. Andrews, Collins, it's urgent," he meekly approached an inner door.

"Mrs. Dauncey, sir. She says she must see you," he said.

A voice within resignedly replied, "All right, show her in." The lack of enthusiasm in the tone might have chilled the timid soul of the little woman under ordinary circumstances, but to-day she had made up her mind that nothing should daunt her, and still holding Jacky firmly, she let herself be ushered into the sacred precincts of the successful lawyer's private office.

"He's having a bad afternoon," muttered the confidential clerk, as he resumed his seat at his desk. "That old tartar of a Mrs. Delaney just gone, and now this young woman turned up again to worry his life out of him."

John Andrews rose uneasily.

"Rose," he began, "you ought not to have come here; you know every time you set foot in this office—in fact, in this town—you impair my position—" He stopped,

shocked by the sight of her emaciated face and form.

"Your position!" she said with a scorn that was new to her. "Your position! It's too late now to think of paltry things like that. I've been sacrificed all along for your position. I've kept quiet, I've eaten my heart out in solitude for your position, but I'm beyond all that now." Her excitement brought on a fresh spasm of coughing distressing to witness.

John Andrews came and stood over her. Her suffering aroused in him a tenderness that her weakness had awakened ten years before.

At last she sank back exhausted but quiet.

"If only you had let me know, Rose, that things were like this with you, something could have been done."

"You remember I wrote asking you to see me, but you took no notice. You just sent that grey-faced man," pointing to the outer office inhabited by the confidential clerk, "with the usual money."

The words went home. "I'll try to make up for it now," Andrews said, eagerly and kindly.

"It's no use now—too late. I got an order for a sanatorium, but when they saw me they said I was a case for the hospital."

She spoke with a quietness that carried conviction; all that was manly in John Andrews' naturally weak nature responded. With strong, unhesitating arms, he raised her from the chair into which she had sunk, and, unmindful of the astonished gaze of the little lad, held her firmly to his breast.

"A case for a hospital! My wife a case for a hospital," he muttered. "Good Heavens! Why was I ever weak enough to be persuaded into a position like this?"

She yielded to his embrace. Her love for him had always been the only strong, determined thing about her. Directly she felt he belonged to her again her womanliness longed to comfort him.

"You were only young, John, and it was quite true that I wasn't suitable. And, as your mother said, I hadn't it in me to rise."

"You were my choice—you were the wife of my youth. Why did I listen to what anyone said about you?"

"We were both young and easily led. I know now I didn't even look ladylike. Your mother thought she was right. I felt bitter at the time, but now it doesn't seem worth while to be bitter about any-

thing or with anyone." She turned to the child with a yearning look. "It's him that give me the pluck to come; he's so like you and yours that even your mother couldn't object to him. You'll take care of him John?"

"I'll take care of both of you," answered Andrews with determination, and as for the first time he let his eyes rest on his nine-year-old son latent paternal instinct stirred in his breast. In that moment he realised what he had sacrificed to his mother's pride.

"What is your name?" he asked, as he placed his hand under the lad's chin. In the little upturned face he saw the portraits of his own ancestors reflected.

"Jacky is what I'm called, but my name is John, after my father," said the child proudly. "It's your name, too, isn't it?" he added innocently.

The man's lips trembled as he said, "That was good of you, Rose; I didn't deserve the child should bear my name."

"It seemed the only name," she replied so simply and prettily that all the old easiness of the courting days came back to them once more, and as twilight fell they sat hand in hand upbraiding themselves, excusing each other, he promising as of yore, she falling under his spell in the old happy way, while the child flattened his nose against the window-pane absorbed in the traffic of the busy street below.

"Rose," said Andrew earnestly, "you must let me take the matter into my own hands—you must let me make amends in my own way. I'll think about the best course, and to-morrow I'll come for you and the child. Now for a taxi. No, not to the station; you are not going to be jolted by any train; it will take you right home. Tell your landlady to do everything she knows how to do for your comfort. Tomorrow I shall come and fetch you."

She shook her head sadly. "No, John, I'm too ill to try to be a lady now. I don't want to come to you now; I used to want to dreadfully, but that has passed. I'm only thinking of Jacky."

"Leave everything to me." Drawing her hand through his arm he patted it soothingly.

So arm in arm they passed through the outer office, oblivious of the scrutiny of the confidential clerk. It took all John Andrews' moral courage to appear in the

street, where he was so well known, escorting a frail, shabby woman, and permitting the demonstrative Jacky to tug at his free hand. It was disconcerting that the desired taxi did not appear with promptitude, but as Rose Dauncey emerged into the chill outside air another spasm of coughing overtook her, and the natural embarrassment of the man of the world gave place to an overwhelming anxiety.

"Expect me early to-morrow, and take care of yourself," were his last words as they slid silently away.

He ascended the staircase, went straight to his own room, and, shutting the door, sat down to think.

He saw her as she had first walked into that office more than ten years ago—a young and very inefficient typist, with pretty, dependent ways that made a strong appeal to him. He had soon realised it would be better to dismiss her and temptation at the same time, but the intercourse was pleasant. It was the first time he had indulged in flirtation, and the novelty held him. The thing glided, he found himself compromised, he found also that she regarded the matter seriously, so seriously indeed that it flattered him.

They had been married secretly in London, where they had spent a short, blissful honeymoon. Then had followed his confession to his haughty, widowed mother, her contemptuous denunciation, and the promise wrung from him to leave his helpless young wife. He remembered the girl's fear as she cowered before the elder woman's anger, making no stand, dumbly accepting her fate, eager only to miss the cruel epithets hurled at her. Then his mind travelled over the intervening years, until lately lived under oppressive regime of his mother, so that independent thought withered, and natural affectionate impulses had to be stifled. Each quarter Collins had borne the allowance agreed upon to a town, some sixteen miles distant, where, according to another stipulation of her mother-in-law, the young wife lived under her maiden name as Mrs. Dauncey.

He recalled how, on a certain morning after his third visit, Collins had nervously entered the private office and announced the birth of a son. For a few days after that news John had wavered in his adherence to his mother. Perhaps her keen wits divined this, for she suddenly determined on an immediate visit to Egypt, a

journey demanding her son's attendance. Six month's travel restored the young man to his naturally submissive state of mind.

* * * * *

The substantial mansion, on the outskirts of the town of Bradfield, inhabited by the Andrews for three generations, was now presided over by John's elder sister, a middle-aged spinster who had inherited in no small measure her late mother's austerity, though in the daughter's case it was tempered by a sense of justice. Still, the thought of his sister's caustic tongue caused John to slacken his speed as he walked up the trim, gravelled drive by which his home was approached.

"I must break it carefully to Agnes," he kept on repeating to himself. When first he started on his homeward journey he said it quite cheerfully, but with the house in full view, and with the thought of his prim sister, sitting rigidly in a straight-backed chair, looking just as his mother had always looked, his heart failed him. The moment his wife became acknowledged he knew everything in the old home would be changed; still, he had made up his mind.

Dinner was silent, restrained; Agnes Andrews was too self-centred a woman to have much general conversation, and to-night John, who usually made an attempt at talking, sat engrossed in his own thoughts.

The parlourmaid withdrew; his tongue was loosened.

"Mrs. Delaney called this afternoon. What a wearying woman!"

"What did she come for?"

"Ostensibly to talk over a mortgage, but really to ask me to dinner."

"She has a widowed daughter returned home to live," said the sister significantly.

"Ah!" ejaculated John. "She reminded me I'd been a bachelor long enough." He leaned across the table and lowered his voice. "Agnes—my—my wife, has been to see me to-day."

His sister started. "She promised mamma she would never come," she answered severely. "I suppose she heard mamma was dead, and so considered the promise not binding. Those sort of people have no nice sense of honour."

"Hush, Agnes!" commanded her brother. "Whatever my wife's faults—and God knows her little faults were so slight that they should only have endeared her to us—

lack of nice feeling was never one of them. In real refinement she is equal to the highest in the land."

"Then why didn't you assert yourself before?" ejaculated Miss Andrews with more common-sense than he had expected her to show.

"Because I was a dull fool and a coward," he answered bluntly.

His sister's next remark surprised him still more.

"I've never agreed with what's been done. I've always felt it was wrong, only while mamma lived I dare not say it; no, even though I was a woman turned forty I hadn't it in me to disagree with mamma in anything. Of course, I think your marriage was foolish, but it was a marriage, and I've hated telling all the lies that the secrecy imposed meant I had to tell."

"And I've hated going about the world a living lie. I've felt a cad every time old Collins has looked me in the face."

"You'll bring her here, of course?" Agnes Andrews' voice faltered. Her short reign had been sweet; moreover, she was heartily attached to the only home she had ever known, and the thought of quitting it hurt her heart as well as her head.

"But you need not go, Agnes. There'll be room for all of us," said her brother, divining her thoughts.

"I shall go," she jerked out in a voice that could trust itself to say no more. Andrews accepted her decision, for he knew her presence would intimidate a girl of her own rank, much more the submissive little creature who had lain helplessly in his arms but three hours ago. Besides, new feelings surged within him; he became conscious that he had been a very lonely man, the joys of a wife and child were suddenly going to be his. He wanted them to himself. He would take them away from the searching winds of Bradfield to a warm South Coast watering-place he had in his mind; the sun should woo back colour to those wan cheeks; his tenderness should coax back the once ready smile; hope would again look out from her loving eyes. Perhaps in a few weeks she would be sitting opposite him at that very table. How the choice flowers, and shimmer, and glitter would please her childlike mind! He leaned back dreaming luxuriously. But there was still her health to be reckoned with; the fairy castles he was building

wobbled as the incessant cough echoed in his ears.

"She's very ill," he said slowly; "very ill."

"What of?" said the practical sister.

"I'm afraid to think what it may be—what it is in fact—a nasty cough—"

"Doctors are very clever, and you can afford the best," said the practical sister.

Andrew took out his watch uneasily.

"It's only half-past eight. I might go to-night and see that she is really well looked after," he murmured apologetically.

"Now, don't be foolish, rushing from one extreme to the other," said the practical sister decisively. "Go and smoke and quieten your nerves."

He was so used to the stern rule of the women of his family that even to-night he was powerless to resist, and walked obediently towards his own particular den.

Half way across the hall he turned back. His sister still stood on the dining-room hearth in deep reverie.

"I forget to tell you, Agnes," he said, with boyish bashfulness, "that there's a child—a boy—just like us." And having made this startling announcement he disappeared again.

"Oh, I'm so glad!" The words were spoken from a lonely woman's heart. She had just been summoning the strength to face a life shorn of all that, to her, made it worth while, and her usually hard face softened at the thought of the new interest a child would bring.

"If they grow absorbed in each other I shall come to see the child," she thought wistfully.

* * * *

The allowance arranged by John Andrews' mother had been in accordance with Rose's position as a typist, and not on the

scale that the wife of a well-to-do man might have expected and demanded; hence the locality that John found himself in the next morning was drab to the point of depression. As he turned into a narrow street flanked by two long rows of houses of dismal similarity, his conscience smote him that his son had been reared in those surroundings, and that the sad malady that gripped poor Rose had had these conditions to aid its progress. The self-condemning thoughts spurred him on, as if he were anxious to end the evil he had wrought.

A capable, cheery woman answered his impatient knock with commendable promptitude. He was glad to realise Rose had been in kindly hands.

"Come in, sir," she spoke as if she expected him. "You'll be the gentleman she mentioned. My husband's just gone to your office, sir."

A great fear took hold of Andrews.

"Isn't she here? Where is she?" he gasped.

"She died at six o'clock this morning, sir. She'd been bad for months, but yesterday, feeling a bit better, she would go out. She came back in a taxicab; she hadn't strength to get out; death had set its seal on her even then. We did everything we could for her, sir."

The words smote him.

"Yes; but I didn't," he said hoarsely.

He stood with clenched lips; the weak mouth seemed suddenly to have grown firm.

"I want to see her," he said.

The woman hesitated as if about to ask his right to intrude into the death chamber, but he brushed past her.

"She was my wife," he said.

FORMS AND TYPES OF STATES IN ANCIENT INDIA

BY NARENDRA NATH LAW, M.A., B.L., *Premchand Roychand Scholar.*

I.

HOW FAR THE ANCIENT HINDUS WERE A
POLITICAL PEOPLE.

THE question as to how far the ancient Hindus were a political people and evolved political constitutions of their own presents an interesting line of investiga-

tion. The subject is indeed one of the many dark spaces in our early history requiring to be illumined, one of the many forgotten chapters awaiting restoration at the hands of painstaking and sympathetic research.¹

1. The sources have been duly acknowledged in their proper places. As regards the Vedic evidence, I am

EVIDENCE ON THE SUBJECT : ADMINISTRATIVE EXPERIENCE.

The fact cannot be gainsaid that the ancient Hindus knew of both small and large states, kingdoms and empires, and acquired the necessary political experience in the administration thereof. There is besides a large literature extant, treating of political topics, which has been handed down from generation to generation.¹

LITERATURE ON POLITICS DIRECTLY OR INDIRECTLY TREATING OF SAME.

These professedly political works are as a rule compilations from other older works and thus serve to preserve the political experience and knowledge of the race. The *Arthasāstra* of Kautilya is a monumental work of this kind which refers to the previous knowledge, and in some points attempts a comparative study of the subject.² There are other works which are more or less representative of their times and throw much light on the subject by their mass of information. But we should draw not merely upon these treatises, or those portions of them that deal

specifically with polity, but also upon others which though not directly treating it, throw many hints and sidelights, the combined effect of which may clear up many an obscure corner of the subject of our enquiry.

FORMS OF GOVERNMENT KNOWN IN ANCIENT INDIA. MONARCHY THE PREVAILING BUT NOT THE ONLY FORM. EVIDENCE OF THE KAUTILYA.

India has seen a multitude of forms of government, and her political experience has not been derived from one form alone. Monarchy was the prevailing form of Government but it was not the only form. The *Arthasāstra* knows of a constitution in which the sovereign power is wielded by a family or clan (*Kulasangha*), and states in connexion with the succession to a vacant throne that a pure monarchy may pass into a constitution of the aforesaid kind by a combination of circumstances.³

NAMES OF THE PRINCIPAL SELF-GOVERNING CLANS IN ANCIENT INDIA.

Kautilya extols this constitution for its safety and efficiency. He also mentions many self-governing clans *viz.*, Lichchhivika, Vriji-ka, Mallaka, Madraka, Kukura, Kuru and Pāṇchālā as well as those of Kāmbhoja and Surāshtra.⁴ Some of these clans appear in the list of the sixteen independent peoples existing at or shortly before the time when Buddhism arose *viz.*, Angā, Magadhā, Kāśī, Kosalā, *Vajji*, *Mallā*, Chetī, Vamsā, *Kuru*, Panchālā, Machchhā, Sūrasena, Assakā, Avantī, *Gandhārā* and Kambojā.⁵ A few other clans of the time were the famous Sākiyas, Bhaggas of Sumsumāra Hill, Bulis of Allakappa, Kālāmas of Kesaputta, Kaliyas of Rāma-gāma, and Moriyans of Pippalavana.⁶

indebted in a special degree to Messrs. Macdonell and Keith's 'Vedic Index,' ('V. I.') references to which are too numerous to be mentioned in each particular case.

1. Besides the printed works such as the Kautilya *Arthasāstra*, Sukraniti, Kāmandakiya Nitisāra, Nityaprakasikā attributed to Vaisampāyana, Nityakyaṁrita of Somadeva, (with their commentaries, if any, in print or manuscript), several Samhitās treat of the subject e.g., Manu, Yājñavalkya &c. Over and above these, there are treatises in manuscript in several libraries in India as well as Europe dealing with the subject or its portions. A list of these about two hundred in number is given in an Appendix to my *Studies in Anc. H. Polity*, vol. II. (in the press) from which these pages have been taken.

Dr. Pramathanath Binerjea, M. A., D. Sc., recently returned from England, kindly informs me that Dr. F. W. Thomas, Ph. D., Librarian, India Office, is bringing out a printed edition of a work on polity attributed to Brihaspati.

2. The 'Arthasāstra' quotes the following schools of opinion *viz.* Manu, Usanas, Bṛihaspati, Bharadvāja, Viśālāksha, Pisuna, Kaupapadanta, Vatavvādhi, Parāsara, Bāhudantiputra [see pp. 6, 13 and 14], Kātyāyana, Kaninka Bhāradvāja, Dīrghaschārāyana, Ghoṭamukha, Kīñjalka, Pisunaputra [p. 251].

The last passage of the 'Arthasāstra' speaks of Kautilya having used many noteworthy works on polity with their commentaries—

Drishṭvā vipratipattim bahudhā sāstreshu
bhāshya-kāraṇām,
Svayameva viśṇu-guptaschakāra sutramcha
bhāshyamcha.

(p. 429).

1. Kulasya vā bhavedrājyam kulasangho hi
durjayah,
Arājavyasanābādhah sasvadāvasati kshitim.
'Arthasāstra,' Bk. I, 'Rājaputra-rakshanam,' p. 35.

2. 'Ibid.,' p. 376.

3. Rhys Davids' 'Buddhist India,' p. 23.

The names common to both Kautilya's and other lists have been italicised. The Vajjians include Videhas of Mithilā and Lichchhavis of Vesālī.

4. 'Buddhist India,' pp. 17-22.

Rāma-gāma i. e. Rāma-grāma identified with Deokali—a city between Kāpilā and Kusinagara. See Cunningham's 'Ancient Geography of India.'

Pippalavana or the Pippala Forest—the site of the Charcoal Tower, see 'Ibid.'

THE ADMINISTRATION OF THE SAKIYA CLAN.

An insight into the administrative machinery of some of these clans can be obtained from a study of the methods by which they disposed of the business of the state. The administrative together with the judicial work of the Sākya clan, for instance, was done in a public assembly—their common Mote-Hall (*Saṇḥāgāra*) at Kapilavastu, where both young and old met to attend to state affairs.¹ The Mallas had a similar hall where Ananda is said to have gone to announce Buddha's death.² An office-bearer corresponding to the Greek Archon, or the Roman Consul and bearing the title of Rājā was elected to preside over the meetings and act as the administrative head.

Besides the Mote-Hall at the metropolis, there were several minor halls at towns and other important places as also in every village within the dominion of each clan, where the local people did their share of administrative business.³ The building of Mote-Halls, rest-houses and reservoirs, the mending of roads between their own and neighbouring villages, the laying out of parks and such other works of public utility, for instance, constantly exercised the co-operation of the villagers including women who were proud to take an active part in these public affairs.⁴ Thus the people obtained opportunities for exercising their head on village and town affairs which gave them a training in the more difficult work of guiding and controlling larger interests common to many such townships and

village-communities. We find an instance of such administration of larger common interests in the local self-government obtaining in the capital of Chandragupta Maurya.¹

THE ADMINISTRATION OF THE VRIJIS.

The Vrijjis or Samvrijjis (i.e. United Vrijjis) were a confederation of eight clans of whom the most important were the Lichchhavis with their capital at Vaisālī, and the Videhas with their chief town Mithilā. The Vrijjis were all republicans,² and the Lichchhavis, we notice, did not elect a single chief like the other clans already mentioned but a triumvirate to conduct their administration.³ The people of Kāśī (Benares) had once their republic which is testified to by their possession of a public hall used as a "parliament chamber for the transaction of public business".⁴

IRL EVIDENCE OF GREEK WRITERS : MEGASTHENES ;

Megasthenes records an Indian tradition that "from the time of Dionysos to Sandrokottos, the Indians counted 153 kings and a period of 6042 years; among these a republic was thrice established,"⁵ which along with the following two passages from the pen of the same authority point to democracies in ancient India:—

(1) "At last after many generations had come and gone, the sovereignty, it is said, was dissolved, and democratic government set up in the cities."⁶

(II) "Maltecorae, Singhae, Marohae, Rarungae and Moruni are free, have no kings

1. 'Buddhist India,' p. 19, quoting Ambaṭṭha Suttanta translated in Rhys Davids' 'Dialogues of Buddha,' I. 113.

2. *Buddhist India*, p. 19, quoting *Mahā-Parinibbāna-Sutta*, 6. 23.

3. *Buddhist India*, p. 20. Each hall was covered with a roof but had no walls (*Ibid.*).

4. *Buddhist India*, p. 49 quoting *Jātakas*, I. 99.

It is no doubt creditable that Indian ladies should discharge the responsible duties of public office. If we take note of their achievements in fields other than the political or public, we may not have reason to doubt their capabilities in the sphere of action. If we are to believe Megasthenes [See Megasthenes' *Ancient India* (Mc Crindle's transl.) Fragm. LVI] we have to credit them with the administration of the Pandya, who, we are told, were the only race in India with women-rulers. And if the references to *Strirājya* in such works as the *Mahābhārata*, the *Bṛhat-Saṃhiti* &c, have any significance, they point to political power wielded by women.

1. See Megasthenes (Mc Crindle), op. cit.

2. Beal's *Buddhist Records of the Western World*, Vol. II, p. 77, f. n. and Rhys Davids' *Buddhist India*, pp. 25, 26.

3. *Buddhist India*, p. 19.

4. *Ibid.*, p. 35 quoting *Jātakas*, 4. 74.

5. Megasthenes' *Ancient India*, Fragm. L.

6. *Ibid.*, Fragm. I. Prof. Hopkins remarks, "Megasthenes plainly implies that self-ruled cities in distinction from cities governed by kings were common in his day. Indeed, his words take such towns as a matter of course." *J. A. O. S.*, VIII, p. 136. He quotes Lassen (*Ind. in Alterthumkunde*, II, pp. 727 and 80) and adds that Vaisālī was such a city with a council of five thousand, each member of which provided one elephant. An officer called *uparaja* under whom was a commander-in-chief of the army, worked on behalf of the people. A *book of customs* regulated their actions.

Ibid., p. 136 f. n.

and occupy mountain heights where they have built many cities."¹

ARRIAN ;

There are further evidences of non-regal states in ancient India. Arrian says that the Nysaiaans were free, had a president and entrusted the Government of their state to the aristocracy.²

CURTIUS :

He also refers to the Oreitai as an independent tribe with leaders, while Curtius mentions the Sabarcae as "a powerful Indian tribe whose form of Government was democratic and not regal"⁴ and the Cedrosii

1. Megasthenes' *Ancient India*, Fragm. LVI.

2. Mc. Crindle's *Ancient India : Its Invasion by Alexander the Great*, pp. 79, 80, 81. For identification of the Nysaiaans, see *Ibid.*, Appendix, Note G, pp. 338-340.

3. *Ibid.*, pp. 167, 168. For identification of the Oreitai, see *Ibid.*, f. nn. on pp. 167, 168.

4. *Ibid.*, p. 252. See *Ibid.* f. n. 4 for identification of the Sabarcae. Lassen identifies them with the Sambastai. Regarding the Sabarcae, Cunningham makes the following remarks in his *Coins of Ancient India from the Earliest Times to the 7th century A. D.*, p. 76 :—"Quintus Curtius mentions a tribe named Sambracæ or Sabracæ who had no king but were led by 'three' generals. Orosius calls them Sabagæ. Now the coins of the Yaudheyas show that they were divided into three tribes, and as Vāgar means a 'warrior,' it is possible that the three tribes may have been called Sam-vārgi or the 'united vāgars.' The great fort of Bhatner is in Bāgar-des and the Bikaner Rāja was called 'Bāgrī Rao' by Akbar. In the same districts also are the Bhatīs, who derive their name from Bhata a 'warrior.' It seems therefore not unnatural to conjecture that the three 'warrior tribes' of Johiyas, Bāgrīs and Bhatīs may be only divisions of the great clan of Yaudheyas or Samvārgis.

According to the same authority (See *Ibid.*, pp. 75-79), one of the best examples of what approaches to the republican or democratic state in ancient India is that offered by the Yaudheyas who organised themselves for military purposes. They are at least as old as Panini ; they resisted the invasion of Alexander ; and they continued in power up to the days of Rudra Daman (A. D. 150) at whose hands they suffered a serious reverse as stated in his Junagadh inscription. The last noteworthy mention we have of them is in the Samudra Gupta Inscription on the Allahabad Pillar (A. D. 470). The long continued autonomy of this military clan is proved by the coins they issued, of which we have numerous finds brought to light dating from the first century B. C. Some of the symbols used on these coins are distinctly of a military significance e. g. Figures 6, 7, 8, 9. (*Ibid.*, op. cit.) which appear soldiers, appear in hand.

as a free people with a council for discussing important matters of state.¹

DIODORUS.

Diodorus describes the Sambastai as dwelling in cities with a democratic form of administration,² and Tauala (a name which has been restored to Patala as its correct form) as "a city of great note with a political constitution drawn on the same lines as the Spartan ; for in this community, the command in war was vested in two hereditary kings of two different houses, while a council of elders ruled the whole state with paramount authority."

THE MALLOI AND OXYDRAKAI.

The Malloi are simply referred to by Arrian as "a race of independent Indians"⁴ but the Oxydrakai, we learn from him, were attached more than others to freedom and autonomy which they preserved intact for a very long time before Alexander's invasion.⁵ The Malloi (i.e. the Mālavas) and the Oxydrakai (the Kshudrakas) figure in a few Sanskrit works e.g. the *Kasikā-vṛtti*⁶ and the *Mahabharata*.⁷

THE KATHAIANS.

There was a race in the Punjab living under democratic institutions viz., the

1. Mc. Crindle's 'Ancient India etc.' p. 262. The name "Cedrosii" is the same as "Cedrosioi" : for identification, see p. 169, f. n. 2.

2. "Sambastai" is, according to some authorities, the same as "Sabarcae" already mentioned. For particulars regarding the Sambastai, see Mc. Crindle's 'Ancient India etc.' p. 252, f. n. 4, and also p. 292.

3. 'Ibid.' p. 296. For identification of Patala, see 'Ibid.' Appendix, Note U, pp. 356, 357.

4. 'Ibid.' p. 140. For identification of Malloi, see Note P, pp. 350, 351 ; Malloi = Malava.

5. 'Ibid.' p. 154. For identification of Oxydrakai, see 'Ibid.' Note P, pp. 350, 351. Oxydrakai = Kshudrakai.

6. 'Ibid.' Note P, p. 350.

7. Arrian mentions the Abastanoi, Nathroi, and Arabitai as independent tribes without any reference to their form of Government. (See Arrian's 'Anabasis' in Mc. Crindle's 'op. cit.' pp. 155, 156, 167. For identification see f. nn. on those pages.) The Abastanoi are identified by some with the Sabarcae. For Siboi and Agalassoi, see V. Smith's 'Early India' 3rd. ed. p. 93 citing Arrian's 'Anab.' VI, 5 ; Curtius, IX, 4 ; Diodorus XVII, 96.

7. They formed part of the Kaurava army in the Great War (Pargiter, in J. R. A. S. 1908, p. 329 citing 'Mbh.', vi, 2106, 2584, 2646, 3852, 3853, 4808, 5484, 5648 ; vii, 183 ; and viii, 137). See also V. Smith's 'Early India,' 74 n. and 94.

Kathaïans, who formed part of the people known as the Arattas (kingless) described by Justin as robbers and denounced as such 'in the *Mahābhārata*, and whom Chandragupta Maurya used as weapons for wresting for himself the sovereignty of the Punjab.¹

III. 'MAHABHARATA' ON THE 'GANAS' OR SELF-GOVERNING COMMUNITIES; DISCUSSION OF THE VARIOUS MEANINGS GIVEN TO THE TERM.

The *Mahābhārata*² expatiates on the policy that should be followed by the monarch in regard to the *Ganas*, and by the *Ganas* themselves for self-preservation. These *Ganas* appear to have been self-governing communities. Though in the *Sānti-Parva* (ch. 107) the word *gana* appears to refer more clearly to self-governing communities than to mere corporations of traders or artisans, or to the "aristocracy in a state" as Mr. Pratāp Roy wrongly translates it, yet it should be noted that the word bears other significations in other contexts. The commentary of Nilakantha is very meagre on the aforesaid chapter, and from what he has said, it cannot be made out that he has put on the word *gana* any other meaning than that of self-governing community. He interprets³ *gana* by *sura-jana-stoma*. The chapter gives some details of its constitution, wherein its members are described as the same by *jāti* and *kula* and its state affairs as conducted by a body of leaders who are advised to keep among themselves alone the matters they discuss (see slks., 23, 24). The commentators of the *Samhitās* appear to be right in interpreting the word *gana* as "corporation" or "guild" in a few

passages.¹ Prof. Hopkins remarks² that the growth of commercial interests led

1. 'Manu, III, 154 has 'ganābhyantar'—a passage which along with many others previous and subsequent, speaks of the persons who should be shunned by good Brāhmanas at sacrifices to the gods and manes. Among the persons thus condemned is included a Brāhmana who is "within a *gana*" ('ganābhyantar'). Bünler following Medhatithi, Govindaraja and Narayana translates it as "one who belongs to a company or corporation i.e. of men who live by one trade." It is further explained by Narayana as "the headman of a village or the leader of a caravan." According to Kulluka and Raghavananda, it means "one who misappropriates the money of a corporation." Monier Williams in his 'Sanskrit-English Dictionary' interprets it as "one belonging to a religious corporation." Here it does not appear that the meaning of "one who belongs to a 'republic'" has any special appropriateness. The same may be said also of 'Vajnavalkya II, 190 (using *gana-dravya*), II, 195 (in which is used the expression 'stent naigamapishandiganam'), I 161 [where 'gana-dikshin' has, according to Monier Williams' 'Sanskrit-English Dictionary' (henceforth indicated as M. W.), among other meanings, that of "one who officiates for a corporation as a priest"]; 'Gautama', XV, 18 (having 'gana-preshya' i.e. "a servant of a guild"), and XVII, 17 (containing the word 'gana'). The same may also be said of 'ganapa' (Varāhamihir's 'Bṛhat Samhitā', XXXII, 18), 'gana-mukhya' (Ibid. xvii, 24), 'gana-pāja' (Ibid. XVI, 33), 'gana-pungava' (Ibid.), IV, 24, 'gana-niyaka' ('Kāthasaritsāgara', C. 41), 'gana-purva' (Mbh., xiii, 1591) and 'gana-pramukha', occurring according to M. W., in Buddhistic Literature. (I have followed M. W. as to the above meanings).

The 'Arthasāstra' also uses the word 'gana' in this non-political sense e.g. in the expression 'kaunsilpugana' in Bk. II, 'Samāhartri Samudaya-prasthigana', p. 61. We need not note here the various other meanings which the word may bear in other contexts e.g. "village-assembly" (Foy's 'Die Königliche Gewalt', p. 20, n. 1), "local committee or court" (Jolly's 'Recht und Sitte' p. 136), 'assemblage' (Dr. Fleet's 'Corpus Inscriptionum Indicarum', III, p. 291 and n. 3)—See also Dr. F. W. Thomas' article, 'J. R. A. S.' 1914, p. 1011. The 'vivadaratnakara' (p. 669) gives its meaning as an assemblage of Brāhmanas.

I may mention that 'gana' (=Vṛta, Sardha) in the sense of guild appears to have had Vedic precedents noted by Roth in the 'St. Petersburg Dictionary' in connection with the 'Panchavimsa-Brahmana', VI, 9, 25; xvii, 1, 5, 12; 'Vājasaneyi-Samhitā' xvi 25; 'Taittiriya-Samhitā', I, 8, 10, 2. This sense has however been doubted by Messrs. Macdonell and Keith. Guilds however existed in Vedic times (See Fick's 'Die Sociale Gliederung', p. 182 and Macdonell and Keith's 'V. L.', I, 140; 341, 342, 403-404 referring to many Vedic passages. Hopkins' 'India Old and New' pp. 169-205 has a chapter on guilds, in which among other things the antiquity of the institutions is traced. According to his opinion, they date back to about 600 B. C.).

1. J. A. O. S. XIII, 81, 82.

1. Mr. Crindle, op. cit., p. 406 Appendix and Mr. Crindle's 'Ancient India as Described in Classical Literature' p. 38 f. n. Aratta is from Sanskrit 'Arashtraka' (see Cunningham's 'Geography of Ancient India', p. 215). Regarding the places occupied by the Punjab autonomous tribes, see Mr. V. Smith's article: "The position of the Autonomous Tribes of the Punjab conquered by Alexander the Great," J. R. A. S., Oct. 1903, utilizing Major Raverly's paper in J. A. S. B., 1892, Part I, entitled "The Mihan of Sind and its Tributaries: a Geographical and Historical Study."

2. Sānti-Parva, 107.

3. 'Sānti Parva', ch. 107, slk. 6.

ultimately to the establishment of a sort of trade unions or guilds. They are mentioned early as of importance (see *Manu*), though they may belong to a late period in their full development. "Such corporations had their own rules and laws subject to the king's inspection, the king not being allowed (theoretically) to have established, or to establish any laws that contradicted those already approved or sanctioned by usage. The heads of these bodies are mentioned together with the priests as political factors of weight whose views are worth grave consideration. As an informal instance of it, we find a prince (Duryodhana) defeated in battle and ashamed to return home—"for what," he exclaims, 'shall I have to say to my relatives, to the priests and to the *heads of the corporations*?'¹ Prominence is given to the *guilds* (?) in the later books of the *Mahabharata*. There also we find *corporations* (?) of every sort under the name *gana*; of the members of which the king is particularly recommended to be careful, since enemies are apt to make use of them by bribery. But dissension is their weak point. Through dissension and bribery they may be controlled by the king. On the other hand 'union is the safeguard of corporations.'²

I should remark that the word "corporation" as used in the above extract does not serve as a good synonym of *sreni* or *gana* in its reference to the self ruled community of military people. Dr. Fleet after much discussion with Dr. Thomas over the proper rendering of *Mālava-Gana-Sthiti* comes to the conclusion³ that though *gana* may have many meanings and has to be translated in in each particular case according to the

context, it is best rendered in the above expression by "tribe". Dr. Thomas objects on many grounds, one of which is that when "coins are used by the authority of a *gana* (which is the case with the Yaudheyas), or an era is maintained by it (which is the case with the Mālavas), plainly the absence of royalty is implied."⁴

The *gana* of the *Mahabharata* (xii, ch. 107) also points to its independence or at least semi-independence which the word "tribe" does not express. In order to bring out this essential implication of *gana*, the word "tribe" should have some qualifying epithet, for which I prefer the expression 'autonomous tribe' (used by Mr. V. Smith), or self-governing community.

Many such communities have been pointed out above as existing in ancient India, evidenced by the *Arthasāstra* and other works of both Indian and non-Indian authors.⁵

OLIGARCHIES IN VEDIC INDIA.

It appears therefore that *gana* has several significations, and may stand for *autonomous tribes*, *guilds*, as well as for local committees, the context making clear its meaning in every particular case.

It does not appear clearly whether any oligarchy existed in the Vedic period. According to Zimmer,⁶ there are traces in a passage in the *Rig-Veda*⁷ that normally there was no king in some states, the members of the royal house holding equal rights. It is compared by him to the state of affairs in early Germany.⁸ Messrs. Macdonell and Keith, however, are of opinion that the passage depended upon is not decisive for the sense ascribed to it, "though of course the state of affairs is perfectly possible and is exemplified later in Buddhist⁹ times."¹⁰ This

1. 'Mbh.' I, 111, 249, 16 as quoted by Prof. Hopkins (J. A. O. S., xiii, 82)=III, 218, 16 (Burdwan Ed.) The Sloka has 'srenimukhyah' = 'silpisanghatamukhya prakritayah' according to Nilakantha. 'Mbh.' xii, 54, 20 and 'Ramā.' VI, 111, 13 (Gorresio) are also cited.

2. 'Mbh.' xii, 107; xii, 59, 49 'srenimukhyopajapena'; Nilakantha understands military 'sreni'. See also 'Manu,' viii, 41.

Cf. "Paṇishadah srenayascha" Gorresio's 'Rāmā.' II, 120, 3 and also "sayodhasreninigam dh." 'Ibid.' II, 123, 5. The military help from the 'sreni' is equal to that from the mercenaries (bhṛta) according to 'Dhṛtarāṣṭra's' calculation ('Mbh.' xv, 7, 8). See 'J. A. O. S.,' xiii, 82.

'J. R. A. S.,' 1915, p. 139.

latter view gains support from the case of Chitraratha who performed a special kind of sacrifice (*dvirātra*) which led to the result that the Chitrarathis were distinguished from other royal families by the fact that "the chief of the clan received a markedly higher position than in most cases, in which probably the heads of the family were rather an *oligar chy* than a monarch (with) his dependents."¹

¹ HOW FAR MONARCHY WAS ELECTIVE IN ANCIENT INDIA; EVIDENCE OF MEGASTHENES AND THE *Rāmāyana*.

Megasthenes records that the *vox populi* was recognised as an effective and potent factor which the responsible officers consulted in cases of failure of heirs in the royal house. On such occasions, "the Indians", we are told, "elected their sovereigns on the principle of merit."² We learn from the *Rāmāyana* that respect was shown to the opinion of the people in the choice of a successor to the reigning sovereign as also on the rather rare occasions of failures of heirs in the ruling house.

Prof. Hopkins says that the assent of the people was obtained to the succession in the first place. After the king's death, the priests and people met in the royal court and decided which prince should be king. The chief priest made an address explaining the death of the king and the necessity for having a new king on the throne. The elder son (Rāma) being banished, the younger must reign to prevent the many evils of anarchy. The older councillors expressed their assent, saying, "Even when the king was alive, we stood at your orders (*sāsane*); proceed, then; give your orders." After this the election was practically over, and only the ceremony remained to be performed."³

THE ELECTIVE PRINCIPLE IN VEDIC TIMES.

There are also traces of the existence of the elective principle in the Vedic times. Zimmer⁴ is of opinion that the Vedic monar-

chy, though sometimes hereditary as can be shown by the several cases in which the descent can be traced,¹ was yet elective in the other instances, though it is not apparent whether the people selected from among the members of the royal house or those of all the noble clans. Geldner² argues however that the evidence for the elective monarchy is not so strong, as the passages³ cited are regarded by him not as indicative of choice by the cantons (*Ṛṣ*), but of acceptance by the subjects. This is of course, as Messrs. Macdonell and Keith observe, no proof that the monarchy was not sometimes elective. The practice of selecting one member of the royal family to the exclusion of another less qualified is exemplified by the legend of the Kuru brothers Devāpi and Sāntanu referred to in Yāska,⁴ the value of which as evidence of contemporary views is not seriously affected by the legend itself being of dubious character and validity.⁵

INSTANCES OF SOVEREIGNS DEPOSED OR EXPELLED.

The power of the people was stronger in those days in proportion to the greater insecurity of the sovereign. There are several references to the latter being expelled from their dominions, and to their efforts to be reinstated to their former position.⁶ The

1. E. g. Valhryasva, Divodisa, Pijavana, Sudasa, Parukutsa, Trasadasya, Mitrathiti, Kurusravana, Upamistava &c.; Linman's 'Sanskrit Reader,' 386. A kingdom of ten generations' (Dasapurushamirajya) is mentioned in the 'Satapatha-Brahmana,' XII, 9, 3, 3. Cf. V, 4, 2, 8; 'Atareya-Brahmana,' VIII, 12, 17.

2. 'Vedische Studien,' 2, 303.

3. Rig-Veda, X, 12, 8; 173; 'Atharva-Veda' I, 9; III, 4; IV, 22.

In some passages (AV, III, 4, 1; IV, 22, 3. Perhaps RV, III, 13, 5. Cf. RV, VII, 39, 2. See Weber's 'Indische Studien,' 18, 22) the use of the word Vispati for a sovereign is taken by Zimmer ('Altindisches Leben,' 164, 165) as indicative of election. The word in the (Taittiriya-Samhita II, 3, 1, 3.) stands evidently for "the chief representative of the 'Vis' i. e. the people or subject class"; see 'V. I,' II, 338.

4. 'Nirukta,' II, 10.

5. 'V. I,' II, 211, 269 top.

6. The technical term is 'aparuddha (expulsion).

XVI, 30; Caland, 'Altindisches Leben,' 37 ff. The 'AV' has spells in the interest of royalty (see III, 3. Cf. Bloomfield's 'Hymns of the AV,' III, ff.)

inviolability of the sovereign's authority is recognized even in the Vedic period, he himself being "exempt from punishment" (*adandya*) but having the power to inflict on others judicial punishment (*danda-vadha*).¹ The expulsion was the last resort of the people who could of course effect it more with the aid of the abnormal circumstances that came about than by dint of their unaided will. The sovereign's immunity from punishment should therefore be taken as the normal rule. A few instances of the sovereigns deposed or expelled from the realms may be cited here: Dushtaritu Painsāyana (the first word literally means "hard to fight"), king of the Srinjayas, was deposed by them from a principality that had existed for ten generations, but was restored by Pātava Chakra Sthapati in spite of the resistance of Balhika Prātipiya,² the Kuru king. Dirghasravas (i. e. far-famed), was also banished from his kingdom,³ as also Sindhukshit who had to remain in exile for a long time before he could be restored.⁴ The case of Vena⁵ being deposed in later times may also be mentioned.

THE POWER OF THE PEOPLE AS EXEMPLIFIED
IN THE RITUAL CALLED RATNAHAVIS.

A trace of the deference paid to the will of the people in early times exists also perhaps in the ritual of the *rājasuya* called the *Ratnahavis* in which offerings were made by the king on eleven successive days in the houses of persons termed *Ratnins* including among others a *kshatriya*, village-headman and such other individuals who were either mere subjects, king's officials, or relatives, to whom or at least to some of whom, the

title of *rājakartri* (king-maker) was applied.¹ Though in later times, the ceremony may have been no more than mere formality observed during the inauguration, yet in its inception in remoter periods, it was probably associated with the deference shown to the opinion of the people, who then wielded much greater power in the state. Some of the *Ratnins* were perhaps representatives of the people or certain classes of the subjects, turned into mere ceremonial figures in subsequent times by the growth of the royal power.

MONARCHY: THE ORDINARY FORM OF
GOVERNMENT IN VEDIC TIMES.

The ordinary form of Government in Vedic times however was the monarchical, as might be naturally expected from the situation of the Indian Aryans surrounded by hostile races. There are clear signs that the power of the monarch was curbed by the existence of the assembly which he had to consult, and concord between them was essential for the prosperity of the former as also of the people at large.²

GRADATION OF KINGLY POWER.
DIFFERENT TITLES INDICATING THE GRADATION.

In the titles assumed by the sovereigns as well as the epithets by which they are mentioned, we find evidences of higher and lower positions among them. Messrs. Macdonell and Keith remark that the states were seemingly small³ and there are no clear signs of any really large kingdoms, despite the mention of *Mahārājas*. This may be true but it does not negative the position that there were royal hierarchies among the states of the early Vedic period. The area upon which the Aryans spread themselves in those times was not even the whole of Northern India,

1 'Satapatha-Brahmana', IV, 4, 4, 7. Cf. 'Pārasakara-Grihya-Sūtra' III, 15 where the "staff" as the emblem of royal, temporal power, implying punishment, is said to be applied by the monarch (*rajapreshito-dandah*).

2 'Satapatha-Brahmana', XII, 9, 3, 1 ff; 8, 1, 17. Weber's 'Indische Studien', I, 205, 207.

3 'Panchavimsa-Brahmana', XV, 3, 25.

4 'Ibid.', XII, 12, 6. According to Oldenberg, 'Zeitschrift der Deutschen Morgenländischen Gesellschaft', 42, 235, fn. 3. Sindhukshit was probably a mythical personage. Even assuming him to be so, the story testifies at least to the expulsion of sovereigns as not an impracticable conception of the people of those days.

5 'Vishnu-Purāna', pt. I, ch. 13.

1 'Aitareya-Brahmana', VIII, 17, 5. 'Atharva-Veda', III, 5, 7. 'Satapatha-Brahmana' III, 4, 1, 7; III, 22, 18. See Mr. K. P. Jayaswal's articles in the 'Modern Review', Jan., 1912, and May and July, 1913.

2 'Atharva-Veda' VI, 38, 3; V, 19, 15. 'V. I.' II, p. 431.

3 'Cf. Hopkins, 'Transactions of the Connecticut Academy of Arts and Sciences', 15, 32 for the 'Panchavimsa-Brahmana'. The 'Satapatha-Brahmana' and the later parts of the 'Aitareya-Brahmana', with their traditions of 'Asvamedhas', 'horse-sacrifices', and their recollections of the glories of the Bharatas represent a more advanced stage of social relations and city life, but even they hardly know really great kingdoms.' 'V. I.' II, p. 254 fn. 65.

and necessarily we cannot expect to have an emperor with a territory extending from sea to sea. Yet among the existing states, one or the other rose to a supremacy over some others which prompted its ruler to assume a title indicative of his superiority to the subordinate states. *Samrāj* is the epithet applied to a "superior ruler" in the *Rig Veda*¹ as also in later works expressing a greater degree of power than that of a *Rājan*² ('King'). *Adhirāja*³ frequently met with in the early Sanskrit literature signifies an 'overlord' among kings or princes.⁴ Similar

ly, we have *Mahāwāja*,¹ *Rājādhirāja*,² *Ēkarāja*.³

some in which a king defeated a few others, the two parties being sometimes aided by their own allies. Sudāsa, for instance, helped by the Tritsus defeated in a great battle the ten kings Sunyu, the Turvasa, the Druhyu, Kavasha, the Puru, the Anu, Bheda, Sambara, the two Vafarnas and perhaps the Yadu who led with them as allies the Matsyas, Pakthas, Bhilinas, Alinas, Vishamins, Sivas, Ajas, Sigras and perhaps Yakshus (V. 1, 1, 320). There is again the fight in which the Srinjaya king Daivata conquered the Turvasa king and the Vrichivants, and another in which the Jahous and the Vrichivants contended for sovereignty. (V. 1, 11, 319, 499). From these, I think, it is not unreasonable to infer that some at least of the terms signifying degrees of power, or superiority and inferiority of rank among kings should denote an actual counterpart created by the victories and defeats in battles which increased or decreased their powers and territories.

¹ 'Aitareya-Brahmana', vii, 34, 9; 'Kaushitaki-Brahmana', V, 5; 'Satapatha-Brahmana', 1, 6, 4, 21; II, 5, 4, 9 etc.

² 'Rajapati' is used of Somu in the 'Satapatha-Brahmana', xi, 4, 3, 9 and is not indicative of temporal supremacy.

³ 'Rajadhiraja', 'king of kings' is used as a divine epithet in the 'Taittiriya-Aranyaka', I, 31, 6 though as a title of paramount sovereignty in later times.

⁴ In the 'Rig-Veda' (viii, 37, 3) the term is used metaphorically. In the 'Aitareya Brahmana', viii, 15, the word according to Weber, 'Über die Königsweihe, den Rājasuya' in the 'Königlich Preussischen Akademie der Wissenschaften' zu Berlin, 1893 p. 141 f. n. 2, means "a king over a 'mandala'." But the expressions used by the 'Aitareya' itself in a subsequent passage of viii, 15 are "Ēkarāt of the earth up to the sea." See also AV, III, 4, 1.

¹ 'Rig-Veda' III, 55, 7; 56, 5; IV, 21, 2; VI, 27, 8; viii, 19, 32.

² In the 'Satapatha-Brahmana' (V, 1, 1, 13; Cf. vi, 8, 3, 4; xiv, 1, 3, 8) the 'Samrāj' is higher than a king. See Weber's 'Über den Vajapeya', p. 6 (in the 'Sitzungsberichte der Königlich Preussischen Akademie der Wissenschaften zu Berlin' xxxix, (1892).

³ 'R V', X, 128, 9; 'AV', vi 98, 1; 'IX', 10, 24; 'Taittiriya-Samhita' II, 4, 14, 2; 'Maitrayani-Samhita', IV, 12, 3; 'Kathaka-Samhita', viii, 17; 'Taittiriya-Brahmana', III, 1, 2, 9; 'Satapatha-Brahmana', V, 4, 2, 2; 'Nirukta', VIII, 2.

⁴ Messrs. Macdonell and Keith after giving the above meaning express doubt whether a real 'overking' is meant by the word, and inclines to the negative view. An over-king of the early Vedic period should however be taken with the limitations peculiar to the age to which he belonged; and we cannot expect to find then the political conditions or the great extent of territory that made the overlords of after times what they were. It is not improbable that a powerful Vedic king should conquer a few others and bring them under his control. Of the battles of the time of which we have record we find

REVIEWS AND NOTICES OF BOOKS

THE POST OFFICE, By Sir Rabindranath Tagore (Translated by Mr. Devabrata Mookerjee) Published by Macmillan & Co. Limited.

W. B. Yeats in his preface to the Post Office writes: 'When this play was performed in London a year ago by the Irish players, some friends of mine discovered much detailed allegory, the Headman being one principle of social life, the curdseller or the gaffer another, but the meaning is less intellectual, more emotional and simple.' This is indeed a very important literary distinction and has to be told again and again in connection with the mystical plays of Sir Rabindra. People are so much anxious about the meaning that it seems they would rather peel off the flesh of the fruit and be

content with the stone. This shows that a delicate literary instinct is a much rarer thing than scholarly erudition or dry intellectuality. Most people approach literature with an intellectual schematism and fail to grasp the deeper suggestion of poetry. They are not satisfied until they can congratulate themselves on the discovery of an allegory, and allegory is nothing but a ready ideality which may coincide with the plot. Thus in an allegory the idea which the poet wishes to communicate is the main thing and the poem or the drama is nothing but a garb which has made it more presentable. In themselves the parts of such a drama do not form one organic whole, but their inter-relation is dependent on the inner meaning—the regulative idea. Apart from this, the drama will not yield any-

thing more. It is this want of relation between the parts, which forces the mind to reject them as non-substantial and to seek for some other deeper reality or Truth, which is sought to be expressed by the poet and as such upholds the whole plot within itself. This idea in an allegory is necessarily forced upon us, as the plot of the drama is made to contain such a contradiction in it, that it falls to the ground of itself and can only be reinstated when looked at from the point of view of the veiled idea. This idea here therefore is not such that it animates the whole frame, but is on the other hand the only life which shines through the radiant form of the whole. Accept the idea, accept the drama, reject it, the drama falls. The Head is the arbiter and not the Heart.

With the Post Office however we have got an altogether different class of literature to handle. Underlying it there is of course some idea, but that idea is not so much expressed by the contradiction of the general plot or the particular characters, as by the resonance of the joyous strain. There is neither any mental crisis nor any absurdity in the development of the plot and we have not to start with an idea in order to get into the drama as in the case of an allegory. On the other hand it makes its effect naturally of itself and the radiant orb of joy which emanates has its crown fringed with the streak of a glorious idea. Instead of the idea leading us to the drama it is the latter which fascinates and enlivens us with joy. Under its quickening touch we are rejuvenated with a divine life and in this youth of delight and joy our ears long for some maiden whispers which it hears from a distance like the humming of the bees. This whispering idea which is the after-effect of joy is essentially different from that which we find in an allegory, for here the idea is not sought for its own sake, but revealed to us in and through a career of joy. The linguistic activity which sustains and accomplishes it is entirely different in character, method and essence and is called *Vyanjana* by the Sanskrit rhetoricians to distinguish it from the other type called the *Lakshana*. The necessary characteristic of *Lakshana* is this that a new meaning or idea is forced upon us by the apparent contradiction of the primary meaning or the meaning on the surface and it is just this sort of an oscillation that constitutes the movement of an allegory, the secret of which consists in this that the plot of the drama, the development of the characters and the mutual relations become strange and absurd without the "Aropa" or the similitude and the shock of this absurdity forces the mind to the similitude (*Rupana*) in the light of which everything becomes clear. The difference between this and the *Rupaka-Dhwani*, the *Vastu-Dhwani* or the *Rasa-Dhwani* is this that here the similitude, the idea, or a delicate emotion (as the case may be) is revealed to us as the echo of the general effect of the drama which is independent in itself like the resonance of the lute or the guitar. The *modus operandi* of this linguistic activity, however, is not so easy to detect as that of the other, for the suggestions here are not revealed either from the primary or the secondary meaning but directly from the inner psychosis of the person of the bearer. The words in themselves are not so much responsible as the skill of the artist. The poet plays the strains of delicate emotion with a touch of his 'inflecting' genius in such a way that our sleeping passions, cravings, yearnings and ideas in the dim twilight region of the subconscious are awakened with a pleasant surprise, and the whole

roll of our psychical personality begins to unwind. Our psychical personality of interpenetrating tendencies receives a suggestive shock and is set in motion of itself through the dominant movement of life itself and we are transported to an ideal world of imaginative structure which appears as much real as the Real itself. This poetic communication, this infection is, therefore, the result of a double action, the objective or that on the part of the poet, consisting in the skill in projecting an image of his own heart for the conceptive faculty and the subjective or that of the reader, consisting in the action of a peculiarly sensitive nature which can receive these projections or communications. Every man says whatever he wishes to convey to his hearers, but it is the poet alone who not only says but sends a thrill as well. So it is that the man in the street hears and understands whatever is said to him, but it is only the fortunate few who have rare poetic faculty that can receive the thrill which a poet sends and can transport themselves into joy. It is neither intellectuality, wisdom, erudition, scholarship or anything of the sort, but like the eye or the ear, it is possibly a different sense and a very delicate one, a special gift of nature, which few people have the fortune to possess.

It is therefore that we often find that with many people, true poetry goes unheeded. They are more busy about the husk, possibly some moral instruction or an intellectual riddle. It is on this account also that we find that many bunglers in literature (otherwise honest and intelligent and sometimes well-read too) are anxious under a patriotic garb to shift the matter and ideal of poetry to a ground which is intelligible to them and demand that the theme of poetry should strictly be restricted to the gross reality around us on which it is the business of the poet to work in such a manner as to transform it into a moral instruction or an ideal. It will be out of place here to enter into any elaborate discussion about this strange confusion of duties between a poet and a moralist of which we have already said more than is necessary for a short criticism like this. Our intention, however, in speaking of all these is simply to invite the attention of our readers to the fact, which they sometimes forget in confusion, that the creation of the poet is essentially a thing of beauty and joy for ever; and Beauty is as true as Truth itself. We know with Kant that Beauty reveals the abiding harmony of the inner and the outer, the microcosm and the macrocosm. It is the revelation of the True to the heart, as what we call truth or the idea is a revelation to the head and there is not the slightest excuse to justify the former by the latter. Beauty is as much its own end as truth itself and as much an ideal of the heart as any idea can be.

It may now be hoped that I may be excused if I make bold to say that the main charm of the Post Office, is neither a moral instruction nor a patriotic ideal but a peaceful and gentle feeling of yearning after the infinite.

The tale itself is very simple. The god-son of a citizen Madhab, Amal by name, is advised by his physician at the time of his illness to be always kept indoors with all the doors shut up. But the child is very intensely anxious to go out, see and enjoy. But he is shut up in spite of it. He sits with a melancholy air by the window and asks every passer-by, the traveller and the dairy man about the world outside, the Shamly river and the Panchmura hills, and almost dies with anxiety to be out to those places. He longs to be

out, he longs to be free; this is the only voice of his life, the only joy that he is capable of enjoying. "Time waits for none but goes on for ever" and Amal longs to "fly with the time to that land of which no one knows anything." He wishes to have a message from the King from his great Post Office set right in front of his window. He sees the flower girl Sudha and would like to go out to the dense forest to blossom there into a Champa with the flower girl by his side as sister Parul. The flower girl promises to give him a flower on her return and goes away. Boys come at his window; he takes part at delight in their play and gives them his own toys, but amidst them all, his anxiety for the King's message persists unabated along with his longing to become free. In the second or last Act the same anxiety for the King's message grows to its utmost intensity as is evident from his conversation with the gaffer; and at last comes the message that the King himself will come to visit him. All doors are flung open and lamps put out and, bathed in the streaming light from the eternity of stars, he sleeps only to awake again at the touch of the King himself.

We may call it a drama or anything we like. There is almost no characterisation, no movement, no conflict. It is nothing more than a simple dialogue of a simple child. There is not even a song to rouse the lyrical spirit within us. It has not followed any law except that of the joy of the poet himself. It is neither a necklace of pearls nor a bouquet of flowers, not only a drop of tear, like a dew-drop on the blade of grass.

The yearning which finds its expression here is the universal yearning of mankind, an aspiration for the Beyond. It is the same as that experienced by a Nachiketa or a Dante. No doubt it is much more simple and gentle and its sound is scarcely more audible than the beatings of the heart but is not on that account less true or constant. We can not agree with Mr. Yeats when he says that the child discovers his deliverance at death, for it is the sweet sleep wherein the child awaits the visit of the King. The yearning has not ceased, the deliverance has not been won, but with a sweet hope, the yearning soothes us into sleep, and this is what is death. In *Phalguni* the poet has tried to see life through the opaque film of death and has discovered for us its true meaning and place. But here there is only the pain, which pierces through us and at once unites us with the created nature around us.

"Beyond and beyond shall we go, illimitable time! and illimitable space! Nothing shall obstruct us, no bondage, however thin; Oh, let us be free, let us be free; this is the simplest cry that whistles through every soul. This yearning runs through us like the spirit of the Holy Quest and brings us to the brink of Death. We await the King who will deliver us from all bondage and sleep with sweet hope, and the soft glimmering beam of our life shines in the firmament of eternity but even then it twinkles and twinkles, Oh Where? Oh When?"

SURENDRANATH DASGUPTA.

SIR RABINDRANATH TAGORE, HIS LIFE, PERSONALITY AND GENIUS, by K. S. Ramaswami Sastri B. A., B. L., Published by Ganesh & Co., Madras. Cloth bound, Pages 536.

At an auspicious moment Rabindranath began the translation of his later poems which has introduced the spirit of modern Bengal into Europe and has bought for it a remarkable place before the

nations of the world. This is indeed a very felicitous thing but the more important achievement is the opportunity that it has afforded to the sister provinces of India to hear the notes of their own joys and sorrows from the strings of the Muse of Bengal, the echo of their hearts in her heart and to feel her as a sister and to claim her as one. It is with great pleasure, therefore, that we hail this devoted admirer of Sir Rabindra from Madras. He has collected with great care and assiduity all that have appeared of Rabindranath in English and this is sure to prove highly interesting to those sincere readers whose hearts leap with joy at the true appreciation of the greatest poet of the time, the glorious son of India from strange minds and strange lands. In a valuable introduction of about 164 pages he has tried to trace the genesis and development of Tagore's genius in connection with his social and other environments and has discussed the value of his literary art with ability. He then deals with the translations, *Gitanjali*, the *Gardener*, the *Chitra*, the *Crescent Moon*, the *King of the Dark Chamber*, the *Post Office* and the *Poems of Kavi* in separate chapters. The last three chapters are devoted to the description of Tagore's works of fiction, *Sadhana* and other miscellaneous writings. The writer's devotion to Rabindranath is so complete that he has done full justice to the poet, so far as it is possible to do without reading all his works in the original Bengalee in a systematic manner. When he would do this we think he would not be pleased with his own work in which he has tried to trace the development of the poet's genius merely in an external manner in which the central spirit of the poet's life (like the one which the poet has himself given us in a short article in *Bangobhishar Lekhak*) has been utterly lost sight of. With a strong and passionate love of Nature as the data and the dynamic of his poetic joy as the principle of movement the poet has discovered for himself his own life in gradual stages and like *Padmapada*, in every step that he has taken, a glorious lotus has bloomed forth. His writings may have similarities with many other writings of other poets and thinkers but they are after all his own; they are not the products of stray acts of imagination but they are necessary links of an unfolding genius. Like the flower of the valley it has indeed grown under various environments from which it has taken the very sap of its life but the superb beauty and fragrance into which it has bloomed are absolutely independent of them all. No biography of Rabindranath can be successful which does not take an account of this essential factor in the development of his mind and art.

S. N. DASGUPTA.

THE LICHEE - ITS CULTIVATION AND CULTURE—by Jnanendra Mohan Dutt, B. L., Member, Bihar Provincial Agricultural Association.

This small pamphlet gives an account of the means by which the lichee is planted in Muzaffarpur and by which a desirable improvement may be brought about elsewhere. The Muzaffarpur lichee is the best of its kind and it is reputed for its exquisite flavour, small seed, abundance of sweet juice, and a nice outward shape and colour. There are four different varieties of lichee found in Muzaffarpur:—(1) *Bedana* (small seeded) (2) *Rose scented* (big fruit with exquisite flavour and sweetness) (3) *China* (late variety) and (4) *Dudhia* (white variety). The culture of all these varieties depends upon the soil where they are planted and their after treatments.

Lichee grows well in a moist sandy soil, fairly retentive of moisture. Gardens planted in old river beds are found to produce best fruits. The lichee does not grow well from seeds. The only means of propagation is by *Guti* or *Anta* grafting, rainy season being the best time for making such graftings and the grafts should as well be planted in rains. Oil cakes and well-rotten cowdung are the best manures for the crop and frequent irrigations are absolutely necessary for the proper growth and fruiting of plants. After the harvest of the crop pruning will secure better fruits in the next year and all wounds caused by pruning should immediately be covered with clay. The pamphlet may be very useful as it is complete in all the informations about the crop from the cultivation to the method of transport of fruits. The present pamphlet bears a testimony to the fact that the author takes a keen interest in agriculture and he has a heart to introduce improved methods of cultivation amongst the ryats. Well-laid mango and lichee orchards are a rarity in Bengal and it is high time for us to pay our best possible attention to our land. Gardening is not only a pleasure but a great profit and the success of which depends mainly on the energy and personal labour of the owner.

This pamphlet of 15 pages only has been priced at annas six which seems to be rather high. Such small booklets written in vernacular and at a cheaper price will be more welcome and useful to the people.

DEBENDRA NATH MITRA, L. AG.
(Bengal Agricultural Dept.)

I. STEPS TO PROPHET ZOROASTER with a Book of Daily Zoroastrian Prayers by Manojit B. Jami, Pithawalla, B.A., B.Sc., Principal of the Sirko Dastur Hoshang High School, Poona [with illustration]. Published by M. B. Pithawalla, 3, Arsenal Road, Poona. Pp. vii+280. Price Rs. 2.

It is said in the sacred writings of the followers of the Majdayasman Religion that

"Yanim muno, yanim zacho, yanim skyisthm, m ashastm Zuvathustrahe" or in Neryosangh's Sanskrit—

शोभनमनाः शोभनवचाः शोभनकर्म ।

बभूव पुण्यात्मा जयशुखः ।

And it may be thus rendered into English: Good was the thought, good was the word, and good was the deed of the holy Zarathustra. Good thoughts (*humata*), good words (*huktha*) and good deeds (*hvarshta*) were the watch-words of the great Prophet of ancient Iran which he practically illustrated by his own life till he was slain by a Turanian when worshipping in the sanctuary. The author is a follower of the faith preached by such a great person, and, with a view to supplying the young students of his community with a useful book on their religion and literature he has written the present volume. It is divided into ten books and provides a great variety of matters in simple English for general reading. Almost all the things which the young students are required to learn have been concisely described or illustrated in it. But the life of the Prophet should have been described to a greater extent even omitting the last two books entirely. A few pages ought to have also been devoted completely to write on Ahura Mazda, the central point of the book, and his creation together with the counter-creation by Angra Mainyu. We see that Dr. Spöner's new theory regarding the Persian influence in ancient

India and the Persian style of Chandragupta's palace excavated in Pataliputra of which much has been discussed in this Review, too, has found its place in Mr. Pithawalla's book!

The Parsees are generally called *Fire-worshippers*, but what the expression really signifies has very clearly and rightly been stated in the following lines by Mr. Pithawalla as if joining with his Hindu brethren:—

"Ours is not Fire-worship or idolatry. Far from it. We emphatically repeat in song No 13 thus: 'Through the agency of Thy Divine Fire, approach we Thee and Thee alone, O Ahura.' Yet we need to add that as long as the soul is imprisoned by flesh, as long as man is absorbed in matters worldly, such a powerful medium as the Holy fire burning on the *sanctum sanctorum* in the Atash-Beheram, is not only helpful but essential to the people at large. It may be possible, at a higher stage of Man's development, to dispense with the aid of such visible natural forms as fire or the symbol of the sun, and meditate upon the abstract qualities of Ahura Mazda without stepping into Temple.... But such cases are rare and what is right and proper for one is not necessarily right for every one else." Pp. 69-70.

The book will serve the purpose of those for whom it is intended, and we have also no hesitation in saying that general readers will have a good deal of information regarding Zoroastrianism from this handy volume which has been dedicated to the Grand Old Man of India, Sir Dadabhai Naoroji and contains some illustrations, two of them being the different plans of the Dokhma or the Tower of Silence as it is often called.

II. THE COMING AND THE PASSING OF ZOROASTER by Rajy, published by the Board of Management of the Sirko Dastur Hoshang High School, Poona. Pp. 27. Address: 3, Arsenal Road, Poona.

This nicely printed booklet with the words "With the Compliments of the Season" contains some stanzas on the advent and departure of Zoroaster.

VIDHUSHEKHARA BHATTACHARYA.

READINGS FROM INDIAN HISTORY, by E. K. Sykes, Pt. I, from Vedic Times to the death of Aurangzeb, viii+248, with 79 illustrations. (Christian Literature Society of India) 2s. net.

The special value of this little book lies in its wealth of illustrations distinctly reproduced, and its attention to art and architecture. But the title of "Readings" given to it is a misnomer. The author's intention to let her readers "read what Indians of bygone ages actually wrote about the events of their time," has been carried out to a fractional extent only, the major portion of the book being in her own words. It should, therefore, be judged as a History of India for students of the familiar type. From this point of view it is readable, but has nothing distinctive in style, arrangement of information.

BEGAMS OF BENGAL, translated from the Bengali of Brajendra Nath Banerji. 124 50. (Mitter & Co., Calcutta, 1915), 12 annas.

It is a carefully written and accurate account of seven ladies of the family of the Nawabs of Bengal from Murshid Quli Khan to Mir Jafar. These ladies, always fair and often frail as well, had great influence on the administration, and hence a correct and scholarly presentation of their lives, though of thin texture, has some value. This little book explains

the moral degradation of the ruling house which made the catastrophes of Plassey and Undhua Nala possible. In the middle 18th century the morals of the "masnad of Murshidabad" were the morals of the barn-door.

AN INTRODUCTION TO ENGLISH HISTORY, Vol. I. Pre-Tudor Period, by A. M. Srinivasha Raghavan, 114-282 (C. Subbiah Chetty, Madras, 1915).

We do not review school-books unless they have any distinctive feature.

LAILI AND MAJNUN, translated from the Persian of Nizami, by James Atkinson, 214-80. (Reprinted by the Printing Office, Allahabad.)

This little book is another example of the useful work the Panini Office has been doing in its own quiet way by reprinting out of print books dear to the heart of the orientalist. Nizami of Ganja, (born 1140, died 1202), is one of the few first-rate Persian poets and his *Laila and Majnun* is one of the most popular of all love-stories in the East. As Prof. Browne writes in his monumental *Literary History of Persia*, Vol. II, "Nizami's high rank as a poet alike original, fruitful, and of rare and noble genius, is admitted by all critics.....If his genius has few rivals among the poets of Persia, his character has even fewer. He was genuinely pious, yet singularly devoid of fanaticism and intolerance; self-respecting and independent, yet gentle and unostentatious; a loving father and husband" (pp. 402-403.) The poem under review is one of his five great romances and runs to nearly 4,000 verses in the original. Atkinson's translation, executed in 1835, is in rhymed verse, smooth-flowing, pleasant to read, and preserving the colouring and spirit of the original, though the elegance, tricks of style and sonorous music of the Persian necessarily vanish in a translation into the tongue of the cold and taciturn Feutons of the white island. Now and then Atkinson rises to true poetry (e.g. p. 13, 67 &c.)

J. SARKAR.

MADRAS VILLAGE PANCHAYATS by M. Siva Aiyangar; published by the Tamil Sangam Press, Madurai. (No price mentioned)

Another little brochure of 17 pp. The writer discusses some of the changes introduced or proposed to be introduced in the constitution and working of Village Panchayats in the Madras Presidency, in consequence of the recommendations of the Decentralisation Commission. The Madras Government have favoured the revival of the old Village Panchayat in the place of the artificial unions but the experiment has been confined within narrow limits. The writer regrets that Government have not conferred exclusive powers to the Panchayats to try petty civil and criminal cases whereby much trouble and expense would be saved to poor litigants.

The new developments in Bengal in connection with the President-Panchayet system with the introduction of the circle officer to oversee the work of unions should be keenly watched by students of village Government in India. The indigenous village Panchayet, however, does not exist in Bengal nor has the Government tried to revive it wherever it may be found to exist. The union is the creature of legislation but several important functions in connection with local taxation, sanitation and the administration of civil and criminal justice in petty cases have been delegated or were proposed to be delegated to them. Hence their importance.

NOTES ON HOLLAND'S JURISPRUDENCE: by Kali Krishnan Bhattacharya. Price Rs. 1 & 40. Mohila Press, 27, 29 Dalalanga Street, Calcutta.

In the preface the author writes as follows: "These notes are an attempt to help the student to master Holland's Jurisprudence (11th edition) within an easy compass, though they are not meant to supersede the original book. For this purpose University questions from 1870 to 1915 have been incorporated in the book and copious tables have been given often bringing the matter of a whole chapter in one page. Austin has been quoted where necessary and the important footnotes of Holland have been given in proper places."

University questions have been printed at the end of each chapter as well as against each para. The book will be useful to students preparing for the degree Examination in Law.

INDIAN LAND REVENUE, TAX OR RENT: by M. S. Saha (bengal), Hony. Secy. Madras District People's Association, etc. (No price mentioned.)

This little brochure of 24 pages is a reprint from the "South Indian Mail" of an article on the above subject by the writer. It is an attempt, a very modest attempt, to summarise the opinions of the principal authorities on the subject of Indian Land Revenue with regard to this knotty problem. The writer concludes with a quotation from the writings of the late Mr. G. V. Joshi to the effect that the tax theory has the weight of authority on its side and should be persistently maintained. Wrote the late Mr. Joshi: "If we, however, strenuously continue to maintain the principle so authoritatively laid down in the court of Directors' despatch of 1856 and subsequently re-approved in the despatches of Sir Charles Wood in 1864 of Lytton's Government in 1880 that the state assessment on the land is revenue only, not economic rent, and that land throughout the country is private property subject to the payment of such revenue, there will be no disposition on the part of our Land Revenue Administration, as there appears to be in some quarters, to enhance its demands upon the land more and more to ominous levels out of all proportion to fiscal necessities and without a proper regard to an equitable distribution of public burdens as between the landholding and other classes."

It cannot be gainsaid that in ancient India the State always took a share out of the produce of the land. But it was a tax pure and simple and its justification was the protection which the state afforded. But in spite of the *Shastric* authority for this proposition and the immemorial custom in support of it—the British Government have found it advantageous to leave things hazy and indistinct. They dare not say that it is a tax and they do not want to rouse public opinion by calling it rent. In either case they will have to face uncongenial logical conclusions.

The Government of India have recently published a despatch which they addressed to Lord Morley in 1910 on the subject of legislative enactment for fixing the proportion of agricultural profits which Government should appropriate as Land Revenue. The arguments urged against this salubrious recommendation of the Decentralisation Commission in the Government Despatch will clearly show that the Government while recognising the necessity of such a limit are afraid of legislative enactment on the subject. The arguments used by the Govern-

ment are specious to say the least of them. If land revenue is a tax on income why should there not be a statutory limit to it and if an Income Tax Act can work smoothly why cannot a Land Revenue Act on similar lines?

B. C.

GUJARATI.

PATAN NI PRABHUTA, by *Ganeshyam*, printed at the Gujarati Printing Press, Bombay, pp. 240. Paper cover. Price Rs. 2-0-0 (1916).

This is a historical novel, receding the times when Gujarat gloried in its own kings. The period chosen is the one when owing to the invasion of the province by the Mahomedans, (Mahmud of Ghazni) Anhilwad Patan, the capital of Gujarat had lost much of its importance. The narrative portrays the struggle of the Jain with the Rajput for mastery, and incidentally depicts the intrigue of the Jain as well as his valor. The creed of 'Ahimsa' did not stand in his way, and he wielded his sword as effectively as his brain when the occasion demanded the use of the one or the other. The story is a "galloping" one, and the patriotism of the inhabitants of Patan, whether Jain or Rajput, when threatened by an alien enemy, is the most creditable episode of the whole story.

VIDYARTHI NI UCHHI BHAVNAO, by *Jalishm'er* *Trikamji Jani*, B. A., L.L.B., Surat, printed at the Saraswati Printing Press, Baranagar, Paper cover, pp. 57. Price Rs. 0-3-0 (1916).

The title of the Book shews the purpose with which it is written.

PRAMATHA PRAN ARPAN, by *Merkhal Mukherjee* *Vera of Haicad*, printed at the Union Printing Press, Ahmedabad. Paper cover, pp. 77. Price Rs. 0-1-0 (1915).

The subject matter of these verses is the miserable life led by an ill-matched couple, and the longing of the wife for a cultured companion. The writer is an advocate of *आत्मसुख* as opposed to *देहसुख*. Some of the verses betray great feeling.

SHRI ANAND KAVYA MAHODADHI, PEARL IV, published by *Naginbhai Ghelabhai Jhaveri*, printed at the Surat Jain Printing Press, Cloth cover, pp. 680. Price Rs. 0-12-0. (1915).

This fourth book in the series of old Jain Gujarati Literature contains the Shatrunjaya Mahatmya of Shriman Jina Harsha, and is edited by a well known Jain Suri, Shri Buddhi Sagar Suri. It is a Rasu, and is written in the last century. The introduction is both entertaining and informing.

BIHAN'S KADAMBARI, by *Keshavlal H Dhruvji*, B. A., printed at the Union Printing Press, Ahmedabad. Cloth cover, pp. 360. Price Rs. 3-0-0 (1916).

Bhahan, a poet who flourished in the 15th century, has written many works. Out of that Mr. Keshavlal has selected his Kadambari for editing and annotating. This is but the first part of Mr. Keshavlal's work, it contains the bare text and its annotation. The more important part, containing the lives of Bhahan and Bana is still to follow. The editor is acknowledged on all hands to be the first and foremost authority on old Gujarati Language and Literature, and in the carefully edited text, and its scholarly notes, he has in no way detracted from the reputation he has established. In fact, the notes are a storehouse in themselves, not only of old lore, and learning, but also of the Alankar Shastra. Reading these notes, we were reminded of the thoroughness with which Rev. Kate'man has edited and annotated Spencer's Faery Queen. Indeed this part of the work sets a model to annotators, and shews how exacting the work of annotation is and what wide knowledge it requires. The three indexes at the end add to the worth of the Book.

ERRATA.

In the August (1916) number of the Modern Review at p 202, column 2, in line 32, read 'later' instead of 'later', and in the last line, 'considerate' instead of 'considerable.'

K. M. J.

COMMENT AND CRITICISM

Can Hindu Civilization be Synthetised ?

BY PRAMATHA NATH ROSE.

I am thankful to "Politicus" for his article reviewing my "Illusions of New India" in the July issue of the Modern Review. I do not know if I deserve all the compliments which he has so generously showered on me. But, there is one compliment he pays me indirectly, and, I think unconsciously, which I can conscientiously lay claim to. He has not often cited me in support of his views though they are diametrically opposed to mine. That shows that I have endeavoured to present both sides of the case dealt with by me fairly. I only wish his quotations

were fuller and a wee bit more impartial. I am afraid he has been too much under the influence of his apprehension that my humble work is likely to be taken as a "sort of Bible" by the "Orthodox reactionaries."

But the compliment which "Politicus" has paid me indirectly is to a great extent discounted by his insinuation, that I have but little first-hand knowledge of rural life in India. If that be really the case, I would certainly be lacking in a very important element of the equipment of an Indian Sociologist;

and the opinions which I have expressed in my work in regard to the condition of my countrymen would be more or less of an academic character. I am, therefore, at the risk of being considered egotistic, constrained to give some personal detail which "Politicus" does not appear to be aware of. My first-hand knowledge of rural life in Bengal, I must confess, is confined to a small part of it, and is chiefly of a reminiscent character being obtained in my younger days some four decades ago. But within the last thirty-five years I have had to travel in various parts of India and Burma, not as tourists (visiting only places of note, but I have had to "live, move and have my being" among village folk every year month after month, usually for six months together. So, I think, I may not unreasonably claim a wider range of Indian rural experience than "Politicus."

"Politicus" is a Neo-Indian of the best type, one who has rejected the outer trappings of Western civilization, and has assimilated, or is trying to assimilate what he considers to be the best in it. He has entered on what he calls the third or "Synthetic" stage of reconciliation of the two opposing movements into a higher synthesis in which "all that is great and good in occidental civilization will be added to and assimilated by oriental civilization," and has relegated my poor self to the lower stage of antithesis, the stage of reaction "fostered by the nationalist impulse" against "wholesale admiration of Western civilization." I am not ashamed to say that I belong to the stage he has assigned me. But I have come down to it (if descent it is)—from the higher stage of antithesis, not without giving such thought to the subject as I am capable of.

Synthesis is a word which sounds very well. But is it possible, except very superficially, in the case of Hindu civilization, which having gone through the stages which the Western civilization is going through now, has attained the maturity, the rigidity and the equilibrium of the third stage? It is all very well to talk of assimilating all that is "good and great" in Western civilization. But it is extremely difficult to determine what is good and great in that or any other civilization. The multitudinous and excessively complex character of sociological phenomena renders the task of analysing them an extremely arduous one. It is a trite observation, that there is hardly any institution or agency which is altogether good or bad and the good and the bad are so intimately intermingled, that it is usually very difficult to separate and weigh them in order to find which way the scale turns. The difficulty is considerably enhanced by the fact, that our ideas of what is good and what is evil are to a great extent influenced by our education and environment. Our education being almost entirely on Western lines, we have along with it imbibed Western ideas and views which, no doubt in many cases unconsciously, affect and colour our judgments. The article of "Politicus" is an excellent example of this Western bias. For instance, his eulogistic observations about the world-war now going on are only an echo of similar observations with which current Western literature has made us so familiar. "Is there no lesson for us," asks "Politicus," "in the marvellous heroism, self-sacrifice, national solidarity, and patriotic ardour, which the world-war has evoked in all the belligerent countries, if not the wonderful scientific skill, brain power, and organising genius which are being displayed by the Western nations on so vast a scale? To be unable to appreciate the moral qualities which lie behind

the nations now in the grip of war argues a blind conceit and self-sufficiency which is a sure sign of decay."

I am not at all ashamed to confess, that I am unable to appreciate the "moral" qualities which the war has "evoked in all the belligerent countries," though I tens lay myself open to the charge of "blind conceit and self-sufficiency." I cannot draw any very sharp line of demarcation between two at least of the belligerent nations and well-organised bands of brigands and even of some lower animals. They appear to me to differ only in the magnitude of the scale on which their operations are conducted. There have been and still are predatory associations who exhibit marvellous heroism, self-sacrifice and solidarity, and the leaders of whom exhibit "wonderful scientific skill, brainpower, intellectual and moral resources, and organising genius."

There is no doubt, that, as "Politicus" says, "from homogeneity to heterogeneity, from simplicity to complexity of structure and organisation is the order of evolution." This is a truth which is recognised by ancient as well as modern thinkers, whether of the East or of the West. But "Politicus" evidences his pro-Western bias when following the great majority of the Westerners he confounds evolution with progress and gives vent to thinly veiled contempt for the "vegetative" and "bucolic existence" of old India "not disturbed by high endeavour and deep thought" and for the "low standard of comfort and a simple scheme of life which characterised them." On the authority of Sir Henry Maine he takes me to task for forgetting that the village communities of India were only "primitive social organisms to which the Hindus owed some rudimentary administration of justice when no government existed outside the village capable of giving authority to court or judge."

The fact that evolution may be progressive as well as regressive is recognised even by some Western thinkers whose pronouncements are taken by Neo-Indians to be gospel truths. I have elsewhere^{*} expatiated upon the evil effects of the amazing advance of Western industries from homogeneity to heterogeneity and shall not take up your valuable space by repeating what I have said there.

The machinery for the administration of justice in our country in pre-British times was certainly "rudimentary" compared to the machinery which has been set into motion now. But except during the short period of anarchy which was concomitant with the dissolution of the Mogul Empire, was it not much less costly and much more expeditious and effective? The present machinery, however scientific and advanced, no doubt invigorates a few limbs of the law, but at the enormous cost of the ruin, economic as well as moral, of a good portion of the rest of the community. The standard of living in old India is not quite so simple and primitive as the majority of Westerners and Westernised Indians consider it to be. Old India is not quite devoid of "high endeavour and deep thought" as they imagine, as is evidenced by the very large number of earnest reformers and profound thinkers which it has produced down to the present day. The social organisation of old India, however, is unquestionably primitive compared to that of the West, and its standard of living is much simpler than what obtains there. But, to put it on no higher ground, would it not be

* *Epochs of Civilization*—"The Root cause of the Great War."

suicidal for a community the average income of whose members does not exceed thirty rupees a year, to adopt the standard of living of a community the annual average income of whose members is more than twenty-two times as much? Does not the simple standard tend to promote indigenous industry, and, by the application of superfluous wealth to works of public utility instead of to personal gratification, foster such qualities of immense survival-value to a community as benevolence and charity? and is not the elevation to the Western standard which "Politicians" and other Neo-Indians plead for tending to deepen our industrial servitude and our impoverishment, and by inordinately intensifying the struggle for animal existence making us more and more selfish and greedy and driving such large numbers to dark and devious by-ways of making money? Whatever Maine, Vincent and other authorities cited by "Politicians" may say, and however they and their followers of New India may sneer at the "primitive," "vegetative" and "bucolic" life of Old India, I would not only not be ashamed to lead it, but would prefer it to the more or less parasitic urban life in New India. The truth is, advance from "simplicity to complexity," from "homogeneity to heterogeneity" is good upto a certain limit which has to be determined by physical,

economical and ethical considerations. The great thing is not perpetual advance in this direction, not continuous rushing forward, called progress, but the establishment of a moving equilibrium between the various forces which make for progress. I have dwelt at length upon this subject in my "Epochs of Civilization" and would refer the curious reader to it. If moving or dynamic equilibrium be established, I see no reason why a comparatively "lowly organism" like Hindu Society which secures the happiness of its members without causing misery to humanity as a whole should not be preferable to the much more complex and imposing but unequilibriumed and, therefore, less stable Western Society which if it secures the happiness of its members at all, it does so at the sacrifice of that of humanity as a whole. The pro-Western bias of "Politicians" is also pronounced in his refutation of my position, that there is more degradation among the masses in the West than among the corresponding classes in India. What I have exactly said in my work is this: "There is more poverty here than in the West, and more ignorance judged by the standard of literacy, but there is much less of squalor and brutality, much less of degradation and misery." This conclusion is based upon experience the range of which, as I have tried to show above, is much wider than that of my critic.

A SUGGESTION FOR INDIAN INDUSTRIALISTS

"IN England a textile manufacturer's factory was taken over by the Government for war purposes. He came to the United States, and bought a factory to continue filling his contracts for goods. Conditions here are so good all round that he means to stay, and he predicts that other manufacturers from England and the Continent will be attracted by the same advantages—larger output due to automatic machinery, and better paid workers, freedom from heavy war taxes, convenience of raw materials, and so on. Best of all, he says, is the feeling of exhilaration he finds in American business—he likes our "pep". His particular line of business is peculiar turbans for the Hindus. The Hindu brother's turban is now made in America at twenty percent less cost than in England, by mill hands who get three times the English wage."

The above extract taken from an article in an American Weekly, sets one wondering when India intends giving up dreaming dreams, on the one hand, and futile grumbling on the other, to do something for herself. There are plenty of politicians in India, but a wretched lack of business enterprise, which far more than any other factor, keeps India in leading strings. So far as one can judge from speeches her activities are limited to importuning the Government and waiting for something to turn up. Yet there are things she could do and do at once that would take her a long way towards her desire if she could shake off her apathy, her habit of relying on Government aid, and her conservatism of ways and means. For instance, how long is she going to contribute to the commercial wealth of other countries, and drain her own strength by receiving and buying goods which

she can manufacture as competently and cheaply herself, if she were really resolved to do it. Why does not India make her own turbans? Why does she not control her own industries, and run her own import and export trade? Why is she content to whine and beg? That is not how England and Germany and America grew rich. England did not win India by war. She won it by Trade—now, and to be, the greatest power in the world—and if India's Rajas, and landholders, merchants and rich men would give as generously for the expansion, protection and mighty future of her industries, as they have towards the war, they will find themselves standing on their own feet quicker than any political power can put them there, and be in a position to contribute more funds to Government to tide over the far more menacing crisis which will have to be faced by all the belligerent powers after the war is over. There are difficulties you say, in the way. There is not a difficulty which cannot be removed. Money and influence are the only things one wants to do anything one likes. India, has the one, she can make the other. Lacs of rupees have been poured out like water for aeroplane funds, ambulance funds, war funds, hospital funds, and many other minor "aids". That was right. India is part of the Empire, and should support it, but she owes a duty, none the less to her own particular bit of it, and a little industrial enterprise started now, with the wonderful opportunities the war offers, could in no wise do aught but succeed.

Now what about this problem? Can India not handle it? Is she the victim of conflicting self-interests, of Government monopoly, and so on? Then go out of India. Do what England and Germany and

America have done to make them what they are. It is not for the Government to send your students abroad by the millions, to come back for the most part useless, for the tread round and round the restricted circle of the political arena is atrophy, and they seem to have no inclination for more useful employment. Send your merchants and capitalists abroad. Let them do what that English manufacturer is doing. Send your ambitious, your energies, and your brains to America; buy and start your factories there, make your money and then bring it back. If foreign goods must come to India, then let there be Indian manufacturing firms in the West, to compete with Western manufacturing firms for a market here, and let India give them their support by placing their orders with them. Money is power. Let India make money, and leave politics alone, and trade will soon put her in a stronger position to resume politics, than she will have without the backing prosperity can give. But if India is not willing to use what wealth and means she has for the good and growth of her people, then let her cease her futile grumbling, her wordy discontent, her anarchy and lawlessness, her snarling at Government, and her contemptible cowardice when the latter shows any inclination to take notice of an offence. These are not the ways of men, and they will not bring India to her goal. If Government

will not give you what you want, get it for yourselves. Do not ask for Government support, that means Government control, and Government already controls the channels through which wealth grows. Commerce and manufactures have been built up by British aid, and is therefore mainly in British hands; it is the same with your railways and steamships, and with your institutions. Change all this. Ask your Rajas and your own rich people to support the venture, and raise the loans, and see if India cannot do business on her own feet. Will you need a readjustment of laws, or new ones to help you to do it? What are the members who represent you on the Council there for? If they cannot do anything for you, then they should not be there at all. Indians ought to be able to bring pressure enough to bear on the members who represent India in Council, to prevent the latter from lapsing into mere sleeping partners in the firm of Government and Co. If she cannot, she is not worth much. If she is worth anything at all she ought to make good. England has a right to what she has made by her manhood, her enterprise, her business capacity and her sacrifices; and her tenacity of purpose—big things to be up against—but India can have those same things by employing the same means. England began with an East India Company. Let India begin with a West India one, and begin now, before the war is over.

MIDO.

GLEANINGS

A Modern Primitive in Art.

It is an unusual thing for an artist to be claimed by opposing camps and hailed as one by each of them. Paulanship, whose sculptures have been an artistic sensation of the winter in New York, has had this strange experience. The progressives "commented on his simplicity," the academicians, regarding him as one of their number, "point with pride to his superb technique." Ninety of his works were sold from his exhibition, private buyers and public galleries competing for possession. His *metier* being found among the primitives of Greek and Indian art, he stands outside the easy and formal classifications, and so is open to adoption anywhere. Having won a scholarship at the American Academy in Rome, Mr. Manship studied there and later in Greece. "Manship traveled extensively and learned a great lesson—the essential unity of all great primitive art, whether Greek, Assyrian, Gothic, Egyptian, or Indian. From each and all of them he took something, molded it to his own purposes or adjusted his personality to the older style." Mr. Manship is not to be admired because he has succeeded in any worldly sense, "but because in a materialistic age he has contrived to affirm an enchanting ideal."

"He has cared for what is right and fine, and the public has cared with him—a cheerful fact, which it is good to have to record. Here is a man who has let his mind rest on ideas of a beguiling interest and

charm, whose reliance upon the traditions of the past has unduly sophisticated his art, depriving it of the racy tang of creative originality, but whose very excess of culture has laid upon his work a certain persuasive bloom, like that of some exquisite hothouse growth. To be exquisite at all is a rare achievement, and, craze or no craze, it is a sound judgment that has brought the public to Mr. Manship's support. It drives unmistakably at the ratification of that principle which chiefly sustains him in his labors—the principle that in art beauty is all."

It is a complex order of beauty that Manship's art embodies. Grace of form he achieves, and in doing so "depends more upon purity of line than upon subtlety of surface." Then, too, "he has the ingenuity of a Renaissance goldsmith in the application of ornament"; his designs have "a bewitchingly decorative quality," and "the whole fabric of his work is animated by a positively realistic feeling for nature."

"And yet it leaves the full tale untold. For the rounding out of that we have to turn to an element not plastic, specifically, but broadly personal; we turn to a state of mind. If Mr. Manship was not so clearly possessed of an instinct for his craft we should be inclined to describe him as a kind of literary man in art, a master of all the cultures, an eclectic to whom the schools have given precisely the sort of inspiration commended by Stevenson to his 'sedulous

"THE SUN-DIAL."

This is a leaf taken by Manship from the art of the Orient.

ape.' Just as an Austin Dobson, say, can take the measure of Pope and do with it what he will, so can Mr. Manship seize the idiom of another age and fairly abash us by his use of it. Consider, for example, the 'Sun-Dial,' which is one of the most charming things in the show and, by the same token, of those which most frankly confess their exotic derivation. Its prototypes are easily discoverable in Indian art. Mr. Havell's book on that subject illustrates a Nepalese Bodhisattva, a copper-gilt statuette in the art-gallery at Calcutta, which will take us very close to the source of Mr. Manship's inspiration. In that the immobile god sits cross-legged on his pedestal, his head enhaloed and his whole figure surrounded by a wreath conventionalizing the sacred bo-tree. Mr. Manship's watcher of the passage of time is a seminude woman; her body is set in a quite different composition, she wears a different nimbus, and in place of the wreath aforesaid there is a wheel-like pattern of dancers, in low relief. In the base the beaded and foliated decoration of the Indian piece gives way to the signs of the zodiac, unrolled beneath the simplest moldings. Mr. Havell describes his Oriental god as holding in one hand the *amrita*, or nectar of immortality. The uplifted hand of the woman of Mr. Manship's 'Sun-Dial' is similarly provided with an emblem, in her case a flower. She, too, with downcast eyes, broods over her endless vigil. Now, we find it impossible to think of the one sculpture existing in the absence of the other; yet we delight in the later work—it is so lovely in itself, and it is executed with such superb skill.

To Mr. Manship's skill and to his taste we are always coming back. Let us accept once for all his intense sophistication, his *flair* for things Greek, things Egyptian, things Roman, things Renaissance,

"THE BABY."

Like a child of the Renaissance, Mr. Manship's little daughter is here depicted within a frame wrought with the detailed skill of a Medicean goldsmith in the application of ornament.

and with it his way of making us feel that we are not in the workshop of a modern artist, but in some European museum of old bronzes. It is at all events an enchanting museum. What he does there he does, a rule, superlatively well. It would be hard to eat the decorative felicity of his terra-cotta flower-boxes. How justly he places the animals that adorn the front of one of them! How perfectly are the rims and bases embellished! The wonderful little relief-portrait of the artist's daughter is almost too consummate. A sculptor of the golden age in Florence would have left it with a softer bloom, a finer simplicity. But both in the marble and in the frame Mr. Manship gets about as near to the art of that period as it would seem humanly possible for a modern man to get. One recalls Bastianini and his marvelous revival of the Renaissance spirit, which 'took in' the *cognoscenti*. Mr. Manship does not take us in. He does not try to. He simply turns Italian—and justifies himself. His work on a large scale is disappointing. The scale is large, but not the number. A group like the 'Dancer and Gazelles' misses the true monumental accent and feeling; it gives one momentarily an uncomfortable sense of a statuette magnified. 'The Infant Hercules' leaves an impression of being overdecorated, overwrought, and this view of the matter is

"PLATYFACEDNESS."

From a bronze by Paul Manship, who ransacks the whole world and all time for inspiration and is called "an eclectic among the masters of the past."

only confirmed on the present occasion. The 'God of Hunting,' an Indian figure, casually attractive in its rich lapis-lazuli tone, ends by asserting itself through bigness without grandeur.

"Not yet has Mr. Manship mastered the secret of heroic sculpture, and as we wonder why, seeing that these very statues, so wanting in authority, are yet so accomplished, so interesting, we are thrown back upon the general tendency of his work and begin to discern a clue. Is it not possible that this gifted sculptor, paradoxically, does not see his subjects sculpturally, does not grasp the masses in form as a sculptor grasps them? The distinction, if on the surface somewhat arbitrary, is at bottom defensible. All the great modelers, Donatello, Michelangelo, to say nothing of the Greeks, have had a way of making you feel the depth and solidity of form: the contour has but followed the mass. Mr. Manship is too willing to stop at the contour, to seek the sharp, pictorially expressive outline."

"Manship in his work reveals himself as free from every form of morbidity, a frank genial nature overflowing with piquant humor, a man of taste who loves superb workmanship for its own sake. He is still too young and his temperament too joyous to create works breathing the poignant pathos of the magnificent fragments at Reim, or comparable with the creations of the ancient meditative geniuses, nor is he aiming to produce gaudiose figures whose souls are tormented. Already, however, his name awakens in our minds the idea of *finesse* and perfection as contrasted with artistic slovenliness, which is such a prevailing fashion in our day. Here is an artist who will never exploit his personality and whose works are so carefully thought out that no points are accentuated. Had Brancusi constructed an amusing

ACROSS THE WHIRLPOOL OF NIAGARA BY TROLLEY.

The car is suspended from six track cables.

sculptural caricature on the lines of the 'Briseis,' the modernists would not fail to call attention to the beautiful simplification, the delightful surface, the solid modeling, and the clever way in which the drapery cuts the line of the nude figure at the back, where as before Manship's work you are simply lost in admiration"—*The Literary Digest*.

Gableway over Niagara's Whirlpool.

The great whirlpool in the Niagara gorge, some distance below the falls, has recently been spanned by a passenger-cableway at a cost of \$60,000. Six parallel cables whose length from one point of support to the other is longer than in any similar structure in the world are kept at constant tension, with the varying load, by automatically adjusted weights at one end, and the weight of the car, as it travels, is distributed among the six, three on each side. The design is of Spanish origin.

The passenger-car is suspended from a running gear which travels on six parallel track-cables of 1-inch crucible-steel rope. Each cable is anchored securely at Colt's Point by means of a 2-inch rod bent into an anchorage in a 740-ton concrete block. At the other terminus each track-cable passes over a sheave and is fastened to a counterweight or stretcher. Boxes of riveted steel contain cast-iron weights sufficient to make a total of 10 tons for each track-cable counterweight. The boxes move up and down freely in steel guides, maintaining the tension in each cable always at 10 tons, regardless of the load on the cables.

Each track cable is entirely independent of the others. The breaking of any one of them would not

be serious, as the other cables would support all the weight of the car without any increase in their tension. The car would drop several feet suddenly, and, after a few vertical oscillations, would assume a new position of equilibrium. Thus the breaking of one cable would not imperil the passengers—and the breaking of two cables at the same time would be very improbable.

The car seats twenty-four passengers and provides standing-room in a raised aisle in the center of the car for twenty-two more, including the conductor.

The car is propelled by a seven-eighths-inch plow-steel traction-cable fastened to one end. The trip can be made in about four and one-half minutes, but it is planned to permit it to occupy six minutes by running at half-speed part of the time.

An automatic control-stop is provided in each terminal, which stops the car without jar.

The car will still be 148 feet above the surface of the water at the point of maximum sag.

—*The Literary Digest.*

The Vitamine as a Key to the Mystery of "Deficiency Diseases."

When physiology was just beginning to be recognized as a distinct science, the articles of our food were regarded as made up of three classes of materials—fats, carbohydrates and proteins and it was thought that if these materials were present in the diet in sufficient quantity, the maintenance of health was assured. Much later it was seen that if the protein element be deficient in certain "amino-acids," no superabundance of the other materials will make good the deficiency and the food is unable to maintain the integrity of the living tissues. The essential factors of a complete diet are therefore more numerous than was suspected. Recognition of the synthetic or building powers of the living organism has suggested the possibility that other substances may be present in the food which are indispensable, whose withdrawal from the diet would be attended with fatal results.

There are certain mysterious substances in the body—the so-called internal secretions, hormones, enzymes and so forth—of which very small traces bring about changes of immense importance in the living organism. These substances are being constantly destroyed and renewed. The peculiarity of their structure suggests that their elaboration is dependent upon the presence in the food of materials essentially different from the common proteins, carbohydrates and fats. If these essential materials are persistently absent from the diet, the normal metabolic processes are likely to become disturbed and deranged culminating in changes of a pernicious character. The justification of this hypothesis is shown in the remarkable light it throws upon a number of diseases caused by a too rigid diet. Such diseases have been grouped as "deficiency diseases." They include rickets, beri-beri, scurvy, pellagra. In each case the condition is attributed to the absence from the diet of an essential material termed vitamine. The vitamine is more or less specific in its action in preventing the onset of the disease. Beri-beri affords a conspicuous example:

"Beri-beri is a disease which used to be common in Japan, the Malay Peninsula and the Philippines—countries where rice is the staple article of diet. That rice consumption was really the cause of beri-beri was suggested as early as 1878,

BIRD BEFORE INJECTION SAME BIRD AFTER INJECTION
OF VITAMINE. OF VITAMINE.

The minuteness of the quantities of these vitamins which are requisite to maintain normal processes of life suggest that they must have something to do with the production of some of the essential hormones, internal secretions, enzymes, etc., in the animal organism.

but Eykman was the first to bring forward, in 1897, evidence which seemed to establish a close connection between the use of 'polished' rice and the appearance of the disease.

"The rice grain.....consists of an inner part and an outer husk. The inhabitants of the regions just referred to live almost entirely on rice which has had its husk removed—polished rice—and Eykman showed that the addition of the missing husk, rice bran, or the substitution of unpolished for polished rice, was sufficient to effect the cure of the disease and prevent its subsequent recurrence.

"Eykman found weakness, and *post mortem*, the

VITAMINE TEST.

Two chickens each two months old. The smaller one has been fed on red rice, the other on ordinary food.

peripheral nerves, the vagus, spinal cord, and cranial nerves all show signs of degeneration whilst the muscles, including the heart muscle, are also degenerated and atrophied. In birds, the paralysis of wings and legs is most apparent, and the head is usually pressed back in a characteristic manner by contraction of the muscles in the neck. When these characteristic symptoms appear, the birds, if undisturbed, seldom live for more than twenty-four hours. Eykman found that if, when such a condition has become developed, the rice bran, or an extract of it, is given to the bird, it rapidly recovers, and, regains its normal condition."

The anti-beri-beri vitamin has also been detected in milk, oats, wheat, barley, maize and beans, in cabbage and other vegetables, in white bread and in ox bran. It is soluble in water and alcohol, and passes through a semiporous membrane. It is destroyed by heating to a very high temperature. As regards its chemical structure not much is known.

A theory suggested by Eykman was that the polished rice contained an injurious toxin and that the husk contained an anti-toxin. But the vitamin theory of Casimir Funk is regarded as the most simple and reasonable explanation of the known facts. "The vitamin being necessary for the maintenance of the metabolic processes, particularly of the nervous tissues, the store of it in the body becomes, on feeding with vitamin-free food, gradually exhausted. First the store in the muscles is called upon, then that in the liver, and finally the heart, brain, and nerves themselves become involved. In this way we can account for the onset of the marked nerve degeneration occurring towards the end of the disease."

Evidence indicates that pellagra is due to a deficiency of vitamins. Scurvy is due to a defect in the food, not in the quantity of it. Experiment establishes the relation of the malady itself to the presence or the absence of vitamins. The exact nature of the anti-scorbutic vitamin has not been shown. Vitamins are not necessarily potassium salts, as one investigator has suggested, nor are they effective because of their acid-neutralizing properties, as another thinks. It would appear at first that there must be several different anti-scorbutic vitamins because of the variability of the curative principle in different food stuffs. It is possible that the real agent is identical in each case:

"The fact that heating the milk destroys the anti-scorbutic vitamin accounts for the appearance of scurvy in infants fed on artificial substitutes for human milk. There is nothing in the whole range of medicine—not even excepting the effect of thyroid extract in myxedema—more striking and remarkable than the immediate and rapid recovery which follows the administration of fresh vegetable material and other fresh elements of food in these cases of infantile scurvy."

The vitamin which prevents beri-beri is quite distinct from that which controls scurvy. It seems probable that rickets is caused by the absence of a vitamin which associates itself with the fatty portion of the diet. Recent work has shown traces of substances in food which regulate the growth of young animals. Altho an artificial diet may be constructed which will maintain rats in health for a few weeks, after this time they invariably begin to decline and slowly die. The addition of a trace of other substances like fresh milk is quite sufficient to transform the inadequate diet into a most nourishing one.

Maintenance is one thing, however, and growth is another. Altho the addition of protein-free milk to the artificial diet is sufficient to render it capable of maintaining health in fully grown rats, it is inadequate to bring about the normal growth of a young animal. For growth some other vitamin must be present which is believed to be contained in the fatty portion of the milk. All experiments go to show that for growth a mysterious "something"—the growth vitamin—is necessary.

"It may be asked in what way do these vitamins act. Do they affect the absorption of food from the intestine? Careful investigation by Hopkins showed

that, in his experiments involving the addition of small quantities of milk, not the slightest difference in the percentage extent of absorption could be discerned, whether the milk was added or not. The rats without the milk absorbed as much food as those with, but evidently the food in the former case was not being properly applied within the body.

"It is also not a question of appetite. The rats without the milk ate as voraciously as the others, and it was only when the rats began to lose weight that the amount of food consumed began to grow less. In many cases it was conclusively demonstrated that the animals on the milk-free diet continued to eat and absorb a quantity containing an ample supply both of protein and energy."

—Current Opinion.

Art of Unkei.

By K. SHIMADA.

Since the Meiji era bronze statues have become popular as memorials to the national heroes of Japan, but of old it was not so, statues of wood being then the usual fashion. The earlier attempts at immortalizing men were in the shape of statues to Buddha or Shōtoku-Taishi; and these were of wood set up in temples, where they were preserved for centuries, a reverence equal to worship being paid to them. They, therefore, received an idolatrous respect never given to the bronze statues of modern times. Statues of heroes had more of a religious than a commemorative significance. Indeed the art of sculpture in Japan grew up simultaneously with the progress of Buddhism, which did so much to promote image worship. Japanese sculpture shared both the fortunes and misfortunes of the religion that supported it.

The earliest Buddhist images came from China about the year 522 A. D. Travelers returning from China, as well as the Buddhist missionaries, brought with them statues of the Indian saint and set them up in their houses to be worshipped. During the era of the Empress Suiko the art of statuary made immense progress, as then the statues of Buddhism was made more stable. Tatsuna, son of the man who brought the first Buddhist image from China, and his grand son, Tōfū, were known as Buddhist sculptors of repute, enjoying the patronage of the great.

Japanese sculpture was greatly influenced also by Korean art. Before the coming of Korean influence Japanese sculpture was unreal and crude, the faces of the statues resembling infancy rather than adolescence. The folds of the robes were shallow and the hair on the head always curled. They were on the whole too stiff and rigid looking to be natural. Engraving and carving were done with only one kind of chisel. After the more frequent intercourse with China, Japanese art students went to that country and returned with improved skill in conception and execution. There was also a large importation of Buddhist images from China. Naturally there came about a blending of Japanese and Chinese art with considerable benefit to Japanese sculpture. Bronze statues began to appear and many of these were cast in Japan. For this, of course, a wooden original had to be carved, over which was built a shell of clay for a mold, the middle being filled up sufficiently with more clay.

These improvements gradually led up to the marvellous artistic advancement of the Nara period. Statues belonging to the Nara period, shows Indian and even Greek influences. The straightness of the forehead running down to the nose shows European

ONE OF THE BRONZE STATUES, BY UNKEI.

influence, coming no doubt through India. In other respects the statue indicates a taste that is purely Japanese.

Thus in the Nara period when Buddhism was at its zenith of prosperity, the art of sculpture and statuary likewise attained its more important development. In that day statues began to be made of clay, molded over a wooden frame on which the shape had been

VAJRAMALLA, CARVED IN WOOD BY UNKEI.

made with straw, a finer plaster being used for finishing. Some of this work was done by putting on first a mixture of mica; then finer lacquer covered with coarser lacquer, over which again cloth was pasted, the finishing plaster being then put on. Another method was to plaster a wooden image, and then after it was dry to cover it with cloth and finish with a layer of lacquer. This method was too simple to admit of anything very fine in the way of art.

During the Heian era the boldness and sublimity of the older school were abandoned for greater elegance and delicacy. The taste of the time inclined to a rotundity of face and form that bespoke the high living of the period, and the clothes suggest a softness and effeminacy that were characteristic. The main motive appears to have been elegance and ease. In the Kamakura period, when knighthood was in flower, the art of statuary declined somewhat, but yet some fine statues of Buddha were produced. The delicacy of the Heian era began to give way to grandness again.

The most distinguished name of the Kamakura period was that of Unkei, after whose time great masterpieces in the way of statuary began to

disappear. The Kamakura era seems to represent the climax of development in this sort of achievement. Being the last of the great sculptors Unkei is remembered more than any of his predecessors. As to the man personally very little is known. He was the son of a man named Kokei, a Buddhist artist of the time. Unkei flourished from 1185 to 1189.

An outstanding feature of the art of Unkei is its realism, the body and muscles of his statues being true to the principles of anatomy. His chisel was always sharp and was driven deep, while his coloring of statuary is beautiful. The expression of motion and feeling imparted to the statues by Unkei are matchless in design and execution. Though it was Teicho who introduced the method of making colossal statues in pieces, the art was brought to its highest perfection by Unkei. By this means the numerous sections of the statue are carved and handed over to pupils for casting, and afterwards they are put together. It is indeed very remarkable how perfectly the various parts of a statue made by the several pupils of Unkei blended and harmonized when put together in the completed whole.

Another novelty introduced by Unkei was that of using crystals for eyes in statues, the suggestion having come from Unkei's father. In all Unkei's art there is a spirit of boldness and daring, though never a divergence from the natural features of human anatomy. Those who came after him were for the most part his imitators.

—*The Japan Magazine*

A Magnetic Hand for Cripples.

The Germans have invented an iron hand that can be powerfully magnetized by switching an electric current into it. With this the crippled veteran can hold firmly all iron tools or utensils. Those made of other substances can be fitted with iron plates and used in the same way. The magnetic hand is the invention of Professor Klingenberg, one of the leading electrical engineers of Berlin.

The accompanying figure shows an armlet which can be strapped on the stump of the arm and is provided at the end with a pot magnet; the latter is mounted on a ball-and-socket joint, so that the magnet-poles can be brought into any desired position, and the magnet can then either be clamped firmly or left movable with a moderate degree of friction. The magnet is supplied with current by means of a flexible cord and a plug, the current being switched on and off by the movement of some other part of the body such as the foot, the chin, or the sound arm, or by a particular movement of the injured arm itself. With this device all articles made of iron can be held in a powerful grip for any length of time, and can be lifted and moved about or released at pleasure. Hence the magnetic hand is suitable for all jobs in which iron tools or iron articles are employed. As a rule, therefore, the tools need not be specially made to suit the requirements of the

An artificial magnetic hand holding a file.

injured man. In the example illustrated the magnetic hand is holding the end of a file, and, being movable with regard to the armlet, offers no hindrance to the control of the file with the sound arm.

Stamping-machines working on sheet iron can be managed as well as with a sound hand, or even better, for the magnetic hand can grip the smooth surface of the sheet. Work can be put into lathes, etc., with the aid of the device while the sound hand makes the adjustments. Tools which are not made of iron can often be easily fitted with iron plates, and switchgear can be manipulated if the levers are so fitted. Magnets of different sizes and tractive forces can be fitted to the same holder.

"The plain magnet as above described, suffices for a variety of simple operations: improvements in the device will readily suggest themselves in particular cases. By means of a switch to fix and release the magnet alternately, the rotation of iron articles can be effected. Special tools can also be devised, such as those tweezers, pincers, and pliers, actuated by electromagnets. There is no special difficulty in providing for the movement of the forearm with respect to the upper arm, the gripping action of artificial fingers and of the thumb, etc. The use even of a portable battery to energize the magnet when away from an electrical installation is not overlooked. No stone should be left unturned to aid our crippled workers, and we trust that good results may be obtained from these interesting suggestions.

—*The Literary Digest*.

INDIAN PERIODICALS

Bengal and the Bengalis

is the title of an appreciative article appearing in the *Indian Review* for July from the pen of "A Madrasee."

The writer asks—what is the root of the surging and sincere life in Bengal that has come to be pre-eminently the stage for the drama of Indian renaissance in art as well as in science, in literature and politics? He goes on to answer the question himself. Says he:

That cannot be in the mere spread of English education which quickens the healthy mind into a thousand yearnings and pursuits, once it is nobly given and as nobly received. For the sister provinces with an equal share of educational advantages have shown none of that ardent and impetuous singleness in the pursuit of the national ideal. It cannot be in the ceaseless and changing course of its history under both Mahomedan and British supremacy. For elsewhere than Bengal the course of history was no smoother. It is in the integrity of its people with its prophets. It is in its united worship of the spirit which brings the learned and the unlearned, the poor and the rich, in one accord.

In Bengal, the national movement has been pioneered from the very beginning for the service of the spirit. Its politicians were religious enthusiasts, and the secular and social movements they brought to birth were the unconscious offshoots of their comprehensive scheme of the new life for India. Reform and propaganda can but serve one time and place, they have an immediacy and narrowness in their ends that cannot supplant any but the passing and mostly inconsequential ailment of the national spirit. But the awakening of the spirit for higher and far-off destinies has in it something vital and expansive. It quickens the national consciousness to a loftier and nobler life. For only the spirit that claims a kinship far and above the temporal can bring even to earthly endeavours that selfless and serious energy which is the first requisite for enduring social action.

After quoting the laudatory observations of Mr. Ramsay Macdonald on the Bengalis and the now-famous passage, in vindication of the Bengali character, from the council speech of the Great Servant of India, Gopal Krishna Gokhale, the writer goes on to say:

This genius for sterling work in the arts and sciences is the legitimate expression of their intense emotionality. For action is always the necessary concomitant of ardent feeling. More than the songs and hymns and prayers, the whole of the Calcutta

School of Art and its exponents Abanindranath Tagore, Surendranath Ganguly and Nanda Lal Bose have enshrined their ascetic politics in their remarkable paintings. They have all striven, through the medium of symbolic idealism, to bring out the vision of a United India, whose subtle harmony neither castes nor commercial competition could draw asunder. The hymns and the songs have become the folklore of the Bengal people and are ever drawing them nearer every day to their national ideal. The pictures have put a higher meaning to the national aspirations of the educated. A united India of such artistic and philosophical idealism is more enduring than any political enfranchisement or geographical unity of race or language.

The Conservative Mind and Eastern Progress.

The arrival of a new radical idea in the minds of men is the sign of a great coming change in human life and society. The reaction of the old idea may triumph for a time but the change is irretrievable. The past can arrive at the most at a partial survival or an euthanasia, provided it knows how to compromise liberally with the future.

Thus opines Aurobindo Ghose in the *Arya*, for July, and we find no reason why any sane person should not agree with the learned writer.

But

The conservative mind is unwilling to recognise this law though it is observable throughout human history; and it is protected in its refusal to see by the comparative rarity of rapid revolutions and great cataclysmal changes; it is blinded by the disguise which Nature so often throws over her processes of mutation.

Because our view of European history is chiefly political, we do not see the constant mutation of society and of thought in the same relief; whereas in the East the great revolutions have been spiritual and cultural and so the political and social changes, although they have been real and striking, fall into the shade and are apt to be overlooked.

Our minds are apt to seize things in the rough and to appreciate only what stands out in bold external relief; we miss the law of Nature's subtleties and disguises. We can see and fathom to some extent the motives, necessities, process of great revolutions and

marked changes and we can consider and put in their right place the brief reactions which only modified without actually preventing the overt realisation of new ideas. For instance the Sullan restoration of Roman oligarchy, the Stuart restoration in England or the brief return of monarchy in France with the Bourbons were no real restorations, but a momentary damming of the tide attended with insufficient concessions and forced developments which determined not a return to the past, but the form and pace of the inevitable revolution.

But Nature has still more subtle and disguised movements in her dealings with men by which she leads them to change without their knowing that they have changed. It is because she has employed chiefly this method in the vast masses of the East that the conservative habit of mind is so much stronger there than in the West. It is able to nourish the illusion that it has not changed, that it is immovably faithful to the ideas of remote forefathers, to their religion, their traditions, their institutions, their social ideals, that it has preserved either a divine or an animal immobility both in thought and in the routine of life and has been free from the human law of mutation by which man and his social organisations must either progress or degenerate but can in no case maintain themselves unchanged against the attack of Time. Buddhism has come and gone and the Hindu still professes to belong to the Vedic religion held and practised by his Aryan forefathers; he calls his creed the Aryan dharma, the eternal religion. It is only when we look close that we see the magnitude of the illusion. Buddha has gone out of India indeed, but, Buddhism remains; it has stamped its giant impress on the spirit of the national religion, leaving the forms to be determined by the Tantricism with which it itself had made alliance and some sort of fusion in its middle growth; what it destroyed no man has been able to restore, what it left no man has been able to destroy. As a matter of fact, the double cycle which India has described from the early Vedic times to India of Buddha and the philosophers and again from Buddha to the time of European intrusion was in its own way vast in change religious, social, cultural, even political and administrative; but because it preserved old names for new things, old formulas for new methods and old coverings for new institutions and because the change was always marked in the internal but quiet and unobtrusive in the external, we have been able to create and preserve the fiction of the unchanging East. There has also been this result that while the European conservative has learned the law of change in human society, knows that he must move and quarrels with the progressist only over the right pace and the exact direction, the eastern or rather the Indian conservative still imagines that stability may be the true law of mortal being, practises a sort of Yogic 'asana' on the flood of Time and because he does not move himself, thinks—for he keeps his eyes shut and is not in the habit of watching the banks,—that he can prevent the stream also from moving on.

Therefore

the hope of the world lies in the re-arousing in the East of the old spiritual practicality and large and profound vision and power of organisation under the insistent contact of the West and in the flooding out of the light of Asia on the Occident, no longer in forms that are now static, effete, unadaptive, but in new forms stirred, dynamic and effective.

The new Orient must necessarily be the result

either of some balance and fusion or of some ardent struggle between progressive and conservative ideals and tendencies. If therefore the conservative mind in this country opens itself sufficiently to the necessity of transformation, the resulting culture born of a resurgent India may well bring about a profound modification in the future civilisation of the world. But if it remains shut up in dead fictions, or tries to meet the new needs with the mind of the schoolman and the sophist dealing with words and ideas in the air rather than actual fact and truth and potentiality, or struggles merely to avoid all but a scanty minimum of change, then, since the new ideas cannot fail to realise themselves, the future India will be formed in the crude mould of the Westernised social and political reformer whose mind, barren of original thought and unenlightened by vital experience, can do nothing but reproduce the forms and ideas of Europe and will turn us all into halting apes of the West.

Writing in the *Hindustan Review* for July about .

Representative Institutions in Indian States

an "Indian Thinker" says that

The only kinds of representative institutions before the Indian States are those of the British Government in England and in India. In the former country they are of the colonial type, while in the latter they are made suitable to a benevolent despotism. The adoption of neither of these is for the highest interests of Indian States, which require institutions of indigenous types. They were formerly in existence, but with the advent and predominance of foreigners they disappeared.

There are three types of Indian Governments: (1) Conquerors (2) Colonial (3) Indigenous.

(1) Conquerors are those in which the rulers are distinct in race and religion, have come from outside and maintain their individuality. The British Indian State, Nepal, Kashmir and such others fall in this category. (2) Colonial States are like the former in origin, but in them the feeling of individuality is not so keen. The Musalman States of Hyderabad, Bhopal, the Maratha States in Central India and most of the Rajput States in Rajputana are examples of this class. (3) Indigenous States are those in which the rulers belong to the same race and religion as the majority of their subjects; such as Travancore, Kolhapur, and Cooh Behar. Generally there is overlapping among these classes; age tends to make all States approximate to the indigenous. Especially this is the case in India.

The ideal for indigenous States is a democratic government. The States of Mysore, Travancore and Sangli have introduced popular institutions of the indigenous types.

They began with popular assemblies and being aware of the fact that owing to the limitations on their exercise of the sovereign powers, the day of a government controlled by the people was not yet, they introduced Legislative Councils, to give a training of the government to the subjects of the States.

There can be no doubt that as between the Indian State controlled by the British Government and the other Indian governments, it is in the growth of the representative institutions and popular control of the administration that their integrity and progress lies. The treaties between them and the paramount power are not dubbed as scraps of papers, but circumstances have been held to modify them. The theory on which the British Government bases its claim of interference in the internal administration of other Indian States is that by treaties it has guaranteed their internal peace and security from external aggression, which means that their subjects have lost the usual remedies against misgovernment. Formerly they could rise in rebellion or seek the protection of neighbouring States. Now the treaty with the British Government comes in their way. Hence the treaties themselves have been held to authorise the paramount power to interfere in cases of misgovernment or minority.

For the same reason there is nothing like a progressive administration in States controlled by Indians. It is open to a ruler to go back over the concessions granted to people by his predecessor. For instance the people will be powerless if a Maharaja of Travancore abolishes the popular assembly in his State, howsoever continuous its tradition might be. There can be no going from precedent to precedent. A suggestion was, therefore, recently made by a British Indian subject that the paramount power should be authorised to prevent an Indian ruler from taking a retrograde step.

The writer goes on to say that although the Indian States ruled by Indians have been shown to consist of three types, yet they are all alike, thanks to the levelling influence of the British Indian Government. Rights which the British Indian subjects possess, will, sooner or later, have to be given to their brethren under native rule. One part of the country cannot raise itself but must drag the other with it, political barriers notwithstanding.

On Ideals.

Under the above heading a thoughtful article has been published in a recent number of the *Arya*. For the benefit of our readers we give a summary of the same.

Ideals are truths that have not yet effected themselves for man, the realities of a higher plane of existence which have yet to fulfil themselves on this lower plane of life and matter, our present field of operation. To the mind which is able to draw back from the flux of force in the material universe, to the consciousness which is not imprisoned in its own workings or carried along in their flood but is able to envelop, hold and comprehend them, to the soul that is not merely the subject and instrument of the world-force but can reflect something of that Master-Consciousness which controls and uses it, the ideal present to its inner vision is a greater reality than the changing fact obvious to its outer senses.

Idea which seems to us to rise out of the fact,

really precedes it and out of it the fact has arisen. Our vulgar contrast of the ideal and the real is therefore a sensuous error, for that which we call real is only a phenomenon of force working out something that stands behind the phenomenon and that is pre-existent and greater than it.

The idea is the realisation of a truth in Consciousness as the fact is its realisation in Power, both indispensable, both justified in themselves and in each other, neither warranted in ignoring or despising its complement. For the idealist and visionary to despise the pragmatist or for the pragmatist to depreciate the idealist and visionary is a deplorable result of our intellectual limitations and the mutual misunderstandings by which the arrogance of our imperfect temperament and mentality shuts itself out from perfection.

Every man who does anything in the world, works by virtue of an idea and in the force given to him by ideals either his own or others' ideals which he may or may not recognise but in whose absence nevertheless he would be impotent to move a single step. The smaller the ideals, the fewer they are and the less recognised and insisted on, the less also is the work done and the progress realised; on the other hand, when ideals enlarge themselves, when they become forceful, widely recognised, when different ideals enter into the field, clash and communicate their thought and force to each other, then the race rises to its great periods of activity and creation. And it is when the ideal arises, vehement, energetic, refuses to be debarred from possession and throws itself with all the gigantic force of the higher planes of existence on this reluctant and rebellious stuff of life and matter to conquer it that we have the great eras which change the world by carrying out the potentialities of several centuries in the action of a few decades.

Wherever and whenever the mere practical man abounds and excludes or discourages by his domination the idealist, there is the least work and the least valuable work done in that age or country for humanity.

On the other hand, when the idealist is liberated, when the visionary abounds, the executive worker also is uplifted, finds at once an orientation and tenfold energy and accomplishes things which he would otherwise have rejected as a dream and chimera, which to his ordinary capacity would be impossible and which often leave the world wondering how work so great could have been done by men who were in themselves so little.

Not only is the upheaval and fertilising of the general consciousness by the thinker and the idealist essential to the practical realisation of great changes, but in the realisation itself the idealist who will not compromise is an indispensable element.

Man approaches nearer his perfection when he combines in himself the idealist and the pragmatist, the imaginative soul and the executive power. Great executive personalities have usually been men of a considerable idealism.

Napoleon with his violent prejudice against ideologues and dreamers was himself a colossal dreamer, an incurable if unconscious ideologist; his teeming brain was the cause of his gigantic force and accomplishment. The immense if shapeless ideas of Alexander threw themselves into the form of conquests, cities, cultures; they broke down the barriers of Greek and Asiatic prejudice and narrow self-imprisonment and created an age of civilisation and soul-interchange.

FOREIGN PERIODICALS

That eminent English critic, Edmund Gosse, writes thoughtfully about

The Unity of France

in the *Edinburgh Review*.

It is unjust and unseemly, says Mr. Gosse, to proclaim surprise at the heroism of the French, or at the calm of the population, its confidence and its unity.

The France which is now so gallantly fighting with us and with the rest of the Allies to prevent the triumph of Teutonic evil is simply the France which has long been in preparation for a life-struggle with the powers of darkness.

Those who detested France and had every spiritual and material reason for deprecating her values continued to repeat, with nauseous iteration, that she was in full decadence, and that her race was eaten out to the core by the white ants of social disorder. The disputes of radicals and moderates, of socialists and reactionaries, of antimilitarists and clericals, were pointed to with glee as the evidences of ethical chaos in a bewildered people, and events like the Caillaux trial and its result saddened the best friends of France as much as they were exulted over in Berlin. What has not been understood has been the superficial character of these symptoms. The pretended levity of Paris was all on the surface; and even there, if the exotic elements were eliminated and the action of the parasitic population removed, there was little for a formalist to condemn or even reprove.

The writer therefore protests against this talk of a New France, risen like a phoenix out of the funeral pyre of the old for the instant purpose of combating the arrogance of Prussia.

The France of to-day is splendid, but her effort is not miraculous: it has long been prepared for by the elements of her ancient and continuous civilization. Those who watched the nation closely before the outbreak of this war have no cause for surprise, though much for gratulation and thankfulness, in the evolution of national character; it is welcome but it is no more than we expected. For fifteen years past, it has been impossible for an unprejudiced and perspicacious observer to fail to see that France has been gathering her moral forces together simplifying her political attitude, preparing without haste for concerted action.

He sets forth in the following lines the causes which are accountable for the rise of France.

Renan urged the France of his day, the France of thirty-six years ago, not to be intimidated by the truculence of her eastern rival, not to endeavor to compete with her mechanical and material culture,

but to cling to all that was refined, sympathetic, and inspiring in the unbroken tradition of the ancient genius of France.

Those who have watched a little closely the movement of affairs in France cannot but have observed the increasing tendency towards energy of action among young men. There has been a steady development in this direction. The French, whose life had tended to run in very conventional channels of practical movement, have enlarged their borders in every direction that leads to individual activity. The cultivation of games, which took a strong upward line from the year 1900 onwards has proceeded so rapidly and so uniformly that when the war broke out last year there was scarcely a country village which did not possess its clubs of football and tennis. Cricket has continued to be a mystery not to be penetrated by the Gallic mind, but the other physical exercises—and with the addition of much more horse-riding and fencing than are customary at present in this country—have extended their influence over the mind as well as the body of young France to a degree which must not be underrated. Games played with energy and spirit extend the sentiment of responsibility, and it is obvious that in this sphere they have had a directly beneficial effect upon French character, the defect of young France at the close of the nineteenth century having evidently been its inability or lack of opportunity, to assert initiative in conduct.

It is not too much to say that the liberty of action which young Frenchmen have insisted upon since the opening of the present century has had an extraordinary effect on their ability to form a rapid and firm decision.

In our opinion it was the crisis of 1911 which enabled the French to take advantage of all the reviving energy of their race and tradition. The country had arrived at a point when all depended upon a shock to its nervous system. Agadir came, and it pulled the whole youth of France together in a sudden splendid unity of purpose.

Shaikh M. H. Kidwai contributes to the *Islamic Review and Muslim India* for June an article on the condition of

Woman

under different social and religious laws. From times immemorial, down to the present day in certain countries, it has been the unhappy lot of the mothers of races to be always kept in subordination and treated as inferior to man in rights and privileges.

In Roman law a woman was completely dependent. As an unmarried girl she was under the perpetual tutelage of her father during his life, and after his death of her agnates by blood or adoption.

When married, she and her whole property passed into the power and possession of her husband. In fact, she herself was treated as a property by her husband, and had no more right than a purchased slave. At certain stages of the Roman law a husband was given a right to kill his wife if she was found to have poisoned somebody, or treated somebody with wine, or adopted as her own child somebody else's child.

The Romans did not allow women to exercise any civil or public office. In fact, a woman could not even be a witness or a curator; she could not adopt nor could she be adopted; she could not be a surety or a tutor. Like her sister in England only about thirty years ago, she had no personal property independent of her husband; she could not make a will nor a contract.

Polygamy was by no means unknown in Rome, though at first it was not a very popular institution. We know for a fact that Mark Antony had two wives, and from that time the institution did not remain unpopular. In the surrounding States generally, and especially among the Tuscans, plurality of wives was always allowed. The Roman marriage required the previous approbation of the father, even if he was insane. The causes of the dissolution of matrimony varied at different times. In the first ages the father of a family might sell his children, and a wife, being reckoned in the number of children, could be disposed of also. He might pronounce her death if she became offensive, or his mercy might expel her from his bed and house; but the slavery of the wretched female was hopeless and perpetual, unless he asserted for his own convenience the manly prerogatives of divorce.

In all Syro-Phœnician peoples bestiality prevailed, and woman was considered only a means for procreation of children.

In Sparta, female infants and such women who could not be expected to give birth to healthy sons were often destroyed, and the result of it was that the proportion of women in the population was reduced and one woman had several husbands. The loan of the wife of one man to another to get a good "breed" was also permitted.

By old Athenians woman was treated only as a property that was marketable and could be transferred from one to the other. She could also be willed away. Those civilized people considered woman a kind of peril or evil. Even at the highest stage of Grecian civilization no other class of women except the prostitute was the subject of any regard, and so if there was any education and culture it was only in the prostitutes. An Athenian was allowed to have any number of wives.

In Persia, men were notoriously voluptuous, and to them woman was nothing more than an object to gratify their base passions. Every wealthy man kept crowds of females in his house, and in the sixth century of the Christian era Mazdak laid down a law that woman should be treated exactly like any other property.

Among the Thracians, Lydians, and the Pelasgian races settled in various parts of Europe and Western Asia the custom of plurality of marriage prevailed to an inordinate extent, and dwarfs all comparison with the practice prevailing elsewhere.

Hindu laws and customs were extremely unfavourable to woman. She was treated as very inferior to man. Their great lawgiver Manu says, "Day and night must women be held by their protectors in a status of subjection," that the woman is under the

subjection of her father when a child, when married under that of her husband, after her husband under her sons, and if she has no sons then to her agnate relations, because there is no woman whatsoever who is fit to be independent. He further says: "Women love their beds and ornaments, and have loose desires. They have a bad temper, are frail, irresolute, and never straight. They should always be kept under subjection and control." That of ill-luck, storm, death, hell, prison, snake, nothing is so dreadful as woman.

Woman was sometimes made the wife of several brothers at the same time. She was sometimes put on the gambling stake and lost.

Even up to the present day there is no limit to polygamous marriages in Hindu society. A Hindu widow cannot adopt a son unless her deceased husband has left her permission to do so. She cannot get any alienable right in property. She is married without her consent when only a child of four or five years of age, amongst certain classes of Hindus. No girl is adopted by Hindus. Remarriage is not allowed. Once married, she cannot get a divorce. Her status in society is negligible.

The wise men of China have offered free advice for the benefit of husbands in these words: "Listen to the counsel of your wife, but act against it."

The old men of Russia have said that "There is only one soul among ten women."

The Spaniards say, "We should save ourselves from wicked women, and should never be captivated by any that have good looks."

The Italians go a step further and pronounce: "As a horse, whether good or bad, requires spurs, so a woman, whether good or bad, requires thrashing."

In Japan, in olden times, women were not allowed to pray or take any part in religious exercises. In China they were not suffered to go into the temples. In India they could not touch gods.

As far as the Arabs themselves were concerned, they treated woman, before the advent of the Great World-Reformer their country produced, worse than perhaps any other people did. They buried alive their daughters. It was considered to be an inauspicious omen if a girl was born to anybody. A woman, after the death of her husband, was treated just like another property, and her own son inherited her as a wife. Innocent girls were offered as a sacrifice to the idols. Orphan girls were forced to marry their guardians. There was no limit to polygamy. Ibn Khaldun says that in some clans even polyandry was permissible.

Sinn Fein.

Louis J. Mc Quilland contributes to the *New Witness* an informing article in which an attempt has been made to present an historical account of the Sinn Fein movement in Ireland, its inception, its constitution, its principles, and its practice.

It is claimed for Sinn Fein that it is a legitimate successor of former patriotic native movements for Irish freedom. Sinn Feiners assert that they are the legitimate heirs of all previous revolutionaries who fought for an Irish Ireland. Their leaders say they are the successors of Wolfe Tone, of Robert Emmet, of Lord Edward Fitzgerald and other eighteenth-century militant Irish patriots—the United Irishmen;

and of John Mitchel, Smith O'Brien, Thomas Francis Meagher, and Charles Gavan Duffy—the Young Irelanders of the nineteenth century who, despairing of the Constitutional Repeal methods of O'Connell, took up arms against the English Government. Ostensibly, the Sinn Féin claim is a sound one but—and this is a great but—circumstances alter cases. The United Irishmen and the Young Irelanders and the men of 1848 and 1867, were fighting against great wrongs and cruel tyrannies; they were fighting for an Ireland which was being bled and starved to death by its English rulers; they were fighting for an Ireland which was being grossly misgoverned by a privileged and despotic caste bent on crushing every national tradition out of the country, and even of depriving her of the last solace of her religion.

At the time when Sinn Féin (meaning "Ourselves") was founded in 1905, practically all the old evil conditions had disappeared. England had ceased to rule Ireland as a conquered and alien colony. The Irish were allowed to worship God in their own way, the country was prospering and was well in the way of continued improvement. It was just on the eve of the return of the Liberals to a long reign of power that the Sinn Féin movement was started. The National Policy of Sinn Féin was outlined in November, 1905, and was based on the principle "that the Irish people are a free people, and that no law made without their authority or consent is, or ever can be, binding on their conscience."

The Sinn Féin program had for its main features the assertion of the existence of an Irish Constitution, the denial of the legality of the Union incorporating the Parliaments of Ireland and England, the denial of the right of the English Parliament to legislate for Ireland, the withdrawal of voluntary Irish support from the armed forces of England, the advocacy of the establishment of a Voluntary Legislature comprising representatives of the existent Irish Councils and Boards, agricultural, commercial and industrial interests, and the Irish members elected to the English Parliament. The National Council laid down, in addition to these sweeping suggestions, further claims for "the establishment and maintenance of an Irish consular system, the re-establishment of an Irish mercantile marine, the development of Irish Sea Fisheries and Irish mineral resources, the control and management by an authority responsible to the Irish people of the transit systems in Ireland, and the creation of a National Civil Service comprising the employes of all bodies responsible to the Irish people."

If there was any failure in the drafting of the Sinn Féin proposals, that failure was not due to want of scope. Colonel Lynch, M. P., points out that while many of their schemes were excellent, including propositions for re-afforestation, arterial drainage and reclamation of waste lands, to carry them into effect would require the expenditure of many millions of pounds. In addition to this, the Congested Districts Board and other similar bodies are now devoting considerable energy to the promotion of such schemes in a sensible way. For the carrying out of their program of complete legislative independence, the National Council only asked for the pathetic sum of £800 a year; and so little confidence had their countrymen in them or their projects that they did not get it.

A salient feature of the Sinn Féin policy against the neighboring country of England was a boycott of all English imports and all English institutions. No Irish Member was to go to Westminster, but

Sinn Féin was to have a self-constituted National Council in Dublin, under the control of which a National Stock Exchange was to be established and National Arbitration Courts formed. The Irish Consul at Foreign Ports, who were, of course, to be quite independent of the resident British Consuls, were to attend to the interests and the development of Irish trade. The fact that Ireland had not a single boat for a merchant marine was a detail beneath the lofty and godlike notice of the National Council.

All these ambitious proposals came under the heading of the "Hungarian Policy." Hungary, in its famous struggle for independence, had established a boycott against Austria, which finally resulted in Hungarian freedom; but it has been pointed out that when the Hungarian delegates left the Imperial Parliament of Austria, they were the representatives of a people hardly less in numbers than the Austrians themselves, drilled and armed, and well inured to war.

Sinn Féin, therefore, began as a Passive Resistance movement, and, failing to effect anything, gradually developed into a physically militant movement. The Sinn Féin Council started by urging that Irishmen should pay no income-tax, but Sinn Féiners continued to pay it. The Sinn Féin Council urged that all British institutions should be banned, but the Sinn Féiners still inflexibly continued to draw their salaries as members of the Civil Service. Their idea was to establish native courts of law.

Morality in War.

Some idealistic persons believe that morality and war are incompatible. They hold that, in the presence of war, which is devilish, it is absurd to talk about morality.

We often forget, sometimes we do not even know, that morality is fundamentally custom. It is a body of conduct which is in constant motion, with an exalted advance guard, which few can keep up with, and a debased rear guard, once called the black-guard. In the substantial and central sense, morality means the conduct of the main body of the community. Thus understood it is clear that in our time war still comes into contact with morality.

This is what Havelock Ellis says in the course of an article contributed to the *Nation*.

The writer is no optimist. He does not exclaim like so many other writers wanting in insight who say that this great war is being waged by the allies to put a stop to aggressive militarism in future. But he looks into the heart of things and says correctly:

When we look back from the stand-point of knowledge which we have reached in the present war to the notions which prevailed in the past, they seem to us hollow and even childish. Seventy years

ago, Buckle, in his "History of Civilization," stated complacently that only ignorant and unintellectual nations any longer cherished ideals of war. His statement was part of the truth. It is true, for instance, that France is now the most antimilitary of nations, though once the most military of all. But, we see, it is only part of the truth. The very fact, which Buckle himself pointed out, that efficiency has in modern times taken the place of morality in the conduct of affairs, offers a new foundation for war when war is waged on scientific principle for the purpose of rendering effective the claims of State policy. Today we see that it is not sufficient for a nation to cultivate knowledge and become intellectual, in the expectation that war will automatically go out of fashion. It is quite possible to become very scientific, most relentlessly intellectual, and on that foundation to build up ideals of warfare much more barbarous than those of Assyria.

The conclusion seems to be that we are to-day entering on an era in which war will not only flourish as vigorously as in the past, although not in so chronic a form, but with an altogether new ferocity and ruthlessness, with a vastly increased power of destruction, and on a scale of extent and intensity involving an injury to civilization and humanity which no wars of the past ever perpetrated. Moreover, this state of things imposes on the nations which have hitherto, by their temper, their position, or their small size, regarded themselves as nationally neutral, a new burden of armament in order to ensure that neutrality. It has been proclaimed on both sides that this war is a war to destroy militarism. But the disappearance of a militarism that is only destroyed by a greater militarism offers no guarantee at all for any triumph of civilisation or humanity.

What, then, are we to do? It seems clear that we have to recognise that our intellectual leaders of old, who declared that to ensure the disappearance of war, we have but to sit still and fold our hands while we watch the beneficent growth of science and intellect, were grievously mistaken. War is still one of the active factors of modern life, though by no means the only factor which it is in our power to grasp and direct. By our energetic effort the world can be moulded. It is the concern of all of us, and especially of those nations which are strong enough and enlightened enough to take a leading part in human affairs, to work towards the initiation and the organisation of this immense effort. In so far as the great war of today acts as a spur to such effort, it will not have been an unmixed calamity.

Poetry and Revolution in Ireland

The *Boston Transcript* gives some account of the poetry written by three leaders of the Irish uprising. We are told that "they were highly educated dreamers, men of great imaginative power and exalted vision, passionately attached to the ideals they followed."

Thomas MacDonagh was the most prominent of all. He was born in 1878, and was consequently thirty-eight years of age when he was executed. He had published five volumes of poetry: "Through the

Ivory Gate," 1902; "April and May," 1903; "The Golden Joy," 1906; "Songs of Myself," 1910; and "Lyrical Poems," 1913. He was for some time editor of *The Irish Review*, the chief literary organ of young imaginative Ireland; and he had published a volume on "Thomas Campion and the Art of English Poetry".

It was MacDonagh's passionate spirit of adoration which made him a poet. Perhaps he found beauty at last in stranger ways and more dear than any of which he had dreamed when he wrote his mysteriously lovely "Litany of Beauty," from which the following is a single fragment:

O Beauty of wisdom unsought
That in trance to poet is taught,
Uttered in secret lay,
Singing the heart from earth away,
Cunning the soul from care to lure—
O mystic hly from stain and death secure,
Till the end of all to stay!
O shapely flower that must forever endure!
O voice of God that every heart must hear!
O hymn of purest songs that dost unsphere
The ravished soul that hears! O white, white gem!
O rose that dost the senses dro'v'n in bliss!
No thought shall stay the wing, or stem
The song, or win the heart to miss
Thy love, thy joy, thy rapture divine!
O Beauty, Beauty ever thine
The soul, the heart, the brain,
To own thee in a loud perpetual strain,
Shudder and sweeter than song of wine,
Than song of sorrow or love or war!

Austere Beauty of Truth
Lighting the way of the just!

Splendid Beauty of Youth,
Staying when Youth is sped,
Living when Life is dead,
Burning in funeral dust!

The glory of form doth pale and pall,
Beauty endures to the end of all.

He also wrote the lines;

I followed a morning star
And I stand by the gate of Light,
And a child sings my farewell to-night
To the atom things that are.

Shakespeare's Ideal of Heroic Manhood.

T. Alexander Seed writing in the *London Quarterly Review* says that King Henry as portrayed in *King Henry the Fifth* is Shakespeare's ideal of heroic manhood.

The play has justly been described as "a national anthem in five acts" and the choruses in it as "patriotic poems," though critics are not wanting who pronounce it "out of date" and "obsolete." Such critics, to say the least of them, are mere dabblers in literature, and they are in evidence everywhere, in Bengal as well as

in England. They always try to attain a cheap notoriety by pooh-poohing some of the masterly creations in literature.

But to come back to Henry V.

Henry embodies Shakespeare's ideal of heroic manhood. He has none of Hamlet's brooding melancholy, none of Romeo's tragic passion. He is first and foremost and almost exclusively a man of action and affairs. As statesman, warrior, ruler, he exhibits the utmost greatness that the active nature can attain. As Macaulay says of Cromwell, "He was emphatically a man"—robust, enthusiastic, brave; a model of heroic virtue, of kingly strength and grace. "Conscientious, brave, just, capable, and tenacious," says Mr. Evans, "Henry stands before us as the embodiment of worldly success; and as such he is entitled to our unreserved admiration."

The youthful king is set before us as a serious and enlightened man of affairs, fearing God and fearing naught beside. His conversion had not been so sudden as the archbishop, like a true theologian, imagined. "Consideration like an angel came" to him at the outset of his career, and remained with him in the midst of his novitiate for the throne; and when the crown at length was placed upon his brow he cast his frivolous companions off without a pang. The change was gradual and complete. With the call of duty, his wild days ended. As king, he now appears before the world as the impersonation of England's greatness. Under his rule, the country is transformed. Profligates and adventurers like Falstaff, Bardolph, Nym, and Pistol, "the cankers of a calm world and a long peace," meet with their deserts. The conspiracy of Cambridge, Scroop, and Grey is destroyed in the bud, and the whole nation is united in one great patriotic movement.

What magnanimity he shows to friend and foe—to his traitor brothers, sorrowing for their father's death and fearful as to their position; to the Chief Justice who had committed him for his mad pranks; as previously he had shown to Douglass and to Hotspur, his beaten foes at Shrewsbury!

King Henry's judgment is tempered by mercy. Yet, when occasion arises, he can be hard as flint, as the Christ Himself. Sternness and severity, if not the most attractive are amongst the most effective of the qualities in Henry's character.

He knows, exactly what he wants to do, and does it. And when he has achieved his purpose he does not boast, but clothes himself in genuine humility. His modesty is beautiful; it gives a charm to the robust and virile personality. Strong men are often proud, successful men vainglorious; but King Henry, at the height of his achievement, is so far master of himself as easily, and as it were instinctively, to give the glory unto God.

His piety is the very marrow of his virtue. It nerves him in the hour of battle; it saves him from the vaunting pride of victory.

Treason.

The following is taken from the *New Statesman*:

"Treason" is a term which covers different

offenses in different periods. It may even be treason in one year to do a thing which it is treason not to do in another. As we are reminded in the "Encyclopædia Britannica" article on the subject, "by one Act of 1534 it was treason not to believe Mary illegitimate and Elizabeth legitimate; by another Act of 1536 it was treason to believe either legitimate; by an Act of 1543 it was treason not to believe both legitimate." Again, Henry VIII made it treason for a queen to conceal the fact that she had been incontinent before marriage. Obviously, treason of this sort will be in the eyes of most people a "venial sin." On the other hand, history does not condone, as venial, treason like that of Alcibiades. Here was a great Athenian general who, having been condemned to death for sacrilege, took service with Sparta, and, having been condemned to death by the Spartans, allied himself to the Persians. In spite of his double treachery, and his readiness to destroy Athens merely in order to avenge his personal wrongs, the Athenians welcomed him back and restored him to his generalship. But though the Athenians forgave him, the moralists of history do not forgive him. They regard him as one of the sublime scamps of the human race—a fascinating blackguard, but none the less a blackguard.

And yet Socrates made him his friend. His fascination is in a measure the fascination of Absalom; he attracts us aesthetically, but repels us morally. And Absalom is but one in a long list of kings' sons who have risen treasonably against their fathers. One remembers how Richard Cœur-de-Lion began his active life as a rebel against his father, Henry II, and how he fought against him at the head of the army of Aquitaine. The truth is, in the ancient and medieval world, treason of this kind was not regarded with nearly the same severity as it has come to be regarded in modern days. Nowadays, that a monarch's son should take arms against him is almost unthinkable.

The following observations on present-day Irish politics are pertinent:

Sir Edward Carson's followers, in taking custom-house officers and police officers prisoners at the time of the Larne gun running, were surely guilty of an act of war against the Crown. The logic of their action was that, if they were resisted, they would use force of arms. It would be absurd to accuse Sir Edward Carson himself of instigating the Kaiser to invade this realm, but many of his followers were quite frank in expressing the hope that Ulster might be saved for Protestantism by a "Continental deliverer." In any case, Sir Edward Carson and all, they made it quite clear that their loyalty to the British Empire was conditional loyalty. They would be loyal in action only provided Ulster had the sort of government she desired. It is unquestionable that at the time many indignant Liberals called Sir Edward Carson a traitor, demanded his trial on a charge of high treason, and regarded him and his followers as, in a moral no less than in a legal sense, wicked beyond measure.

No one can doubt, however, that in the common affairs of life the average follower of Sir Edward Carson is an excellent example of a moral human being. He may be the victim of foolish superstitions and foolish fears, but, in so far as he is disinterested, his treason does not shock us as a thing morally base, but chiefly as an offence against the State to which he claims to be loyal.

R. F. writing in the *Athenæum* about

The Question of Sex in Fiction

opines that in judging a book the intention and general scheme of the writer must be considered: his book must be judged, not by its contents alone, but also by the meaning of those contents and their relation to life in general and himself in particular.

Wherever the writer has a definite plan of which the book criticised is only one part, or, again, where the one book is in itself a study extending beyond the phases criticised, there is justification for reasonable freedom of speech.

Realism in fiction, verse, or drama is not, and can not be, an end in itself; it is only a means towards another end, which other end, in actual practice, is usually quite outside the poem, play, or novel.

The New Realism.

Arthur Waugh in the *Fortnightly Review* pays a glowing and just tribute to the youth of to-day in an ably written article.

"We are living, beyond question," says he, "in the heyday of the young men; all the kingdoms of the world are in their hand."

Thirty or forty years ago there still lingered in the social and literary atmosphere the faint mist of a tradition that experience was the one authority in life, and that youth must expect to serve its apprenticeship before it could claim the privilege of the final word. That tradition has long since dissolved and vanished. Nowadays experience is held in very modest repute; energy and initiative are the universal passports to recognition. And nowhere is this truer than in the field of literature, where, it is scarcely necessary to add, youth and rebellion have always been in a state of conflict with tradition. Until recently, however, innovation has had to fight its way; the serried ranks of criticism and convention have hindered its progress; and no doubt the opposition has done it good, by forcing each new change to justify itself before it could pass the outposts. Today there are no outposts to pass, and experience gives way at once to the challenge of youth. It almost seems as though criticism were perpetually afraid of being accused of senility and decay, so ready is it to accept everything new, and to fall into line behind the advancing banners of youthful revolu-

tion. Like Stensgard in Ibsen's drama, the young men of the hour may cry with confident justification: "We are young. The time belongs to us, but we also belong to the time. Our right is our duty."

But of all the regions of activity in which youth is asserting its mastery—social, political, scientific, and the rest—there is no field which it has so thoroughly made its own as that of the novel. And here the audacity of its advance is the more impressive, since the art of fiction is the one art above all others in which experience would naturally be expected to be an almost indispensable quality of the artist. For the novel seeks not only to tell a story, but to portray and moralize life; and the neophyte, standing on the threshold of the temple, can hardly help being dazzled by the wealth and variety of the sights that stretch before his gaze. How can he possibly interpret in his first glance the virtues of the architecture or the intricate symbolism of the decoration? Of course he cannot do so; and the most penetrating and representative fiction of any generation will continue to be written by men whose judgment is tempered by the mellow maturity of experience. But there are qualities vouchsafed to youth which have faded away by the coming of middle age; and the last few years have seen a new movement in English fiction so full of vigor, sincerity, and spiritual beauty as to promise for the future, if only its edge is not dulled by the traffic of time, an entire revolution in the conventions of the British novel, clearing away a vast burden of traditional cant, and establishing a fresh and decent relation between the essential facts of life and their artistic revelation. This movement we venture, for want of a more comprehensive title, to define as the New Realism; since the object of the realist is to draw life as it stands, and there is nothing with which these young men are so eagerly concerned as the fidelity of their art to life; while at the same time the method upon which they set to work is altogether new being absorbed in emotional and spiritual analysis of a deeply intimate and personal kind—a kind, indeed, which has rarely, if ever, been associated with the practice of realism in the past. It is in effect, a New Realism of the emotions, as contrasted with the conventional realism of conditions and environment; its interest is not the material convenience or inconvenience of life, but the spiritual achievement of man, and his ultimate realization of his soul's possibilities. For the artist of the new realism the Kingdom of Heaven lies within the soul of man; for the realist of the last generation, it was almost invariably sought from without, in the individual's relation, with the rest of the world, and in the general improvement of social and human conditions. And the advance from external consolations to the consolations of the soul is an evident advance of the highest significance, and of the most hopeful promise for the future.

NOTES

"Hate thine Enemies."

Knowing that it is not quite possible for imperialistic nations to strictly follow what Jesus is said to have taught—so long, of course, as they remain wedded to imperialism, we have never thought it necessary to pay serious attention to what preachers of their established churches say. But a sermon recently preached by the Bishop of Calcutta having created some stir in Anglo-Indian circles, it may not be considered impertinent on the part of a non-Christian to offer a few remarks. The Bishop is said to have asked his congregation to forgive the enemy, meaning the Germans. He did not, we presume, ask his hearers to abruptly bring the war to a close. He did not want any change in their outward conduct; he wanted only to bring about a change in their inner sentiments. This was in perfect keeping with the Christian exhortation "Love thine enemies." "Forgive thine enemies" is not so great a demand on one's clarity as "Love thine enemies." Still Anglo-India is said to be not in a mood to listen.

Inward feeling, no doubt, governs outward conduct. It may, therefore, seem impossible for men of a loving and forgiving disposition, answering to the "Christian" ideal, to wage war. But it is not unthinkable and unimaginable that a man should fight in a dispassionate and detached spirit, as the *Gita* teaches. A teacher can chastise an offending pupil without getting angry or ceasing to love him. It may not be impossible for men to look upon war as a painful necessity and to fight without ceasing to cherish the feeling of brotherhood even towards a most brutal and barbarous enemy. But this is sure to be looked upon as a counsel of perfection, particularly when it comes from people who do not belong to the warlike races. But whatever martial races may think, charity is among the greatest, if not the greatest, of virtues.

Why Home Rule is not wanted.

The manner in which the Government of India Consolidation Amendment Bill was

introduced in the House of Lords, shows that it is the intention of the authorities to save us not only the trouble of making laws for ourselves but also the trouble of expressing any opinion on any new piece of legislation. This considerateness on their part ought to be highly appreciated. We, the people of the East, have as our highest ideal spirituality, calm meditation. All causes of distraction should, therefore, be avoided. The work of legislation or criticism of legislation is sure to distract our minds. The Home Rule cry should, for this reason, be discouraged.

Government of India Bill.

Reuter has cabled that "in the House of Commons, Mr. Asquith announced that the Lords had agreed to the Commons' amendment to the Government of India Amendment Bill." How very considerate it is of Reuter not to say what the Commons' amendments are! Every one is anxious that the people of India should not lose their spiritual characteristic. Therefore they are told just enough to enable them to include the Commons in their daily prayers. If the Commons' amendments had been cabled out, some unmeditative fellows would have commented upon them, thus disturbing the condition of perfect calmness which ought to characterise the oriental mind.

Anglo-India clamoured against the clause of the Bill which wanted to take away the right to sue the Secretary of State in certain cases, and against the clause which would have enabled traders to have seats in the executive councils, without giving up their interest in commercial concerns. These clauses have, therefore, been dropped. Some Indians are flattering themselves that Indian opposition to these clauses had also something to do with their deletion. The result of the Indian opposition to the Civil Service ("Temporary") Act does not encourage us to live in this fools' paradise.

The London correspondent of the *Tribune* writes:—

The opening of civil and military appointments in British India to subjects of Native States was

represented as a step in the direction of Indian unification. With regard to military appointments the view put forward was that this provision would make it easier later on to give commissions to qualified Indians generally. There is little in the terms of the Bill to support this anticipation, but the statement appears to have satisfied those who were doubtful upon the point. One further alteration I understand the Committee have made in the Bill as drafted. They have struck out the provision which would have enabled the subjects of adjacent territories or the members of independent races or tribes in those territories to be appointed to civil offices under the Crown.

The London correspondent of the *Indian Mirror* writes :—

No further alteration of any substance was made in the Bill except that the power to appoint to civil offices under the Crown will not extend beyond those who are rulers or subjects of any State in India. That is to say, the subjects of any State in territory adjacent to India, or the members of any independent race or tribe in such territories will not be eligible for appointment.

Supposing these two correspondents are correctly informed, one is curious to know whether "the subjects of any State in territory adjacent to India, or the members of any independent race or tribe in such territories" will be eligible for *military* appointments. That is really the most important point. As we have pointed out in previous issues, civil appointments in India, particularly high ones, require a knowledge of English, in which qualification Indians in British India are generally superior to other Indians and other Asiatics, and therefore our anticipation, expressed previously, was that the clause in the Bill relating to the widening of the area of recruitment for civil and military appointments was meant chiefly to obtain soldiers and military officers from outside British India. This view is now confirmed by what the *Tribune* correspondent says, *viz.*, "with regard to military appointments, the view put forward was that this provision would make it easier later on to give commissions to qualified Indians generally." Whether "this provision would make it easier later on to give commissions to qualified Indians generally", is a matter of opinion. Our opinion was expressed in the August number as follows :—

"Should the Bill become law, one of its probable or possible effects might be the garrisoning of India by Asiatic mercenaries who are not British Indian subjects or even Indians. This might not happen, but it also might happen. Indians have been for a long time past demanding commissions in the army. Indian ruling chiefs and their relatives might, accord-

ing to this clause, be given such commissions, and the demand of British Indian subjects shelved in this way."

Disbanding of the Bengal Ambulance Corps.

In a recent speech of Lord Carmichael's there was a reference to the Bengal Ambulance Corps and the cause which led to its disbanding. The only thing that could be gathered from the speech was that a mistake was responsible for its disbanding ; but one would seek in vain to find whose mistake it was, what was the nature of the mistake, why the mistake could not be rectified, &c. Truly His Excellency has a most luminous and delightful way of speaking.

U. S. A. "Preparedness."

The present war has roused the United States people to prepare themselves for any coming fray in which they may be engaged. It is advocated that their programme should include sixteen battle-cruisers, a type of war-vessel whose superiority has been proved in recent naval engagements. England has ten of these ships in commission, Germany nine and Japan four. The American ships are to be much faster, and to have greater horsepower, heavier guns and a greater volume of gun-fire than either their German or British rivals.

This has roused the ire of Japan. *The Japan Magazine* writes :—

Not satisfied with having a navy twice the fighting strength of the Japanese navy, Washington is busy with preparations for a still more gigantic programme. The battle cruiser is a type of ship invented by the Japanese after the war with Russia and was quickly taken up by Great Britain, Russia, and Germany ; and now it is being adopted by the United States.

Germans in Japan.

We read in the *Japan Magazine* :—

The undue freedom accorded enemy aliens in Japan while they are subject to internment in the other Allied countries, is a constant source of wonder to Britishers, Frenchmen, Belgians and Russians residing in Japan. Ever since the war broke out Germans and Austrians in Japan have proceeded with their affairs unmolested, carrying on trade just the same as before the war ; and subjects of the Allies have not been without suspicions of intrigue against Allied interests being hatched among these aliens. Remembering that it was at the German Club in Singapore that the mutiny among soldiers there was planned, some cannot fail to surmise that similar conspiracies may be germinated at the German club in Kobe and Yokohama. The German bark in those ports has

also been open for business as usual and with no lack of funds; while there is every facility for communication between Germans in Japan and those in China through their Japanese agents.

The Czar's Assurances to the Poles.

Current Opinion gives welcome news. It says:—

Russian dailies of importance, including the "Slovo" (Moscow), understand that Emperor William is perturbed by the solemn renewal of the Czar's pledge to Poland. Poland will be a nation using her own tongue, teaching her own culture in her own schools of all grades up to the university itself, declared Mr. Sazonov to the Duma. Germany, he said, in effect, will grant Poland nothing like that. The episode became dramatic when the Polish deputy in the Duma, Dr. Hrusiewicz, affirmed that his country is irrevocably with the allies because they have sworn fealty to the principle of nationality. The Poles, he added, believe in the Russian pledge of a unification of dismembered Poland. They see in the words of Premier Sturmer the promise of a Polish nation governing itself with the Czar as a constitutional sovereign. The form of the words was bold but the French press is a unit in deeming the Polish deputy correct. If the details supplied by the *Figaro* are correct, Poles throughout the world are for the most part assured of the good faith of the Russian pledges. Even the somewhat suspicious *Homme enchaîné* (Paris) edited by Clemenceau, is convinced that the Poles are justified in their acceptance of the Czar's pledges to their country.

It is said that Germany and Austria, too, have resolved to constitute an autonomous Poland. Whatever the motives of the powers concerned and whoever succeeds first in giving Poland freedom, the addition of one more free country to the list of those which are self-ruling would be a gain to the cause of liberty.

Russo-Japanese Relations.

Since the outbreak of the European War, Japan has been supplying war materials and has shown extreme good will to Russia. In return the Russian Government has determined to transfer a part of the Eastern China Railway at a reasonable price in token of its gratitude.

Terms of the Japan-Russian Alliance.

The terms of the recent treaty of alliance concluded between Japan and Russia, as reported by the *Nichi-nichi* of Japan, are as follows:—

"1. Russia shall cede to Japan that section of the Manchurian railway between Changchun and a certain point near Harbin. This will afford Japan's South Manchuria Railway an easier access to the Russian metropolis in Manchuria.

"2. Japan shall supply Russia with arms and ammunition as long as the war in Europe lasts.

"3. Russia shall accord liberal treatment to the

Japanese residing and engaged in business in Eastern Siberia and north Saghalien, as well as in the railway zone of north Manchuria.

"4. Russia shall throw open to international commerce the harbor of Vladivostok, and shall not increase the armament of the port to such an extent as would cause apprehension on the part of Japan.

"5. Russia and Japan shall respect each other's interests in Manchuria and Mongolia. Should disturbance arise in the Russian sphere of influence in these territories while Russia is engaged in the war against Germany and Austria, Japan shall, upon Russia's request, undertake to pacify the country.

"6. In case Japan is obliged to take necessary measures to preserve the peace and open-door in China, Russia shall not hinder the execution of such measures. Should a third Power or Powers obstruct such measures, Russia shall, upon Japan's request, take common action with Japan for the removal of such obstruction."

Indian Emigration to America.

The Review of Reviews writes:—

The vexed problem of the Indian immigrant is again to the fore. It is a strange anomaly that the men who have so valiantly fought in our ranks would not be admitted into Canada if they presented themselves there with their wives and children. And the consequence is that the United States House of Representatives has passed a Bill aiming at the exclusion of Indians and justifying the measure because they are not admitted into Canada. The Burnett Bill was designed to exclude Japanese as well, but Viscount Chinda has successfully intervened. Perhaps Sir Cecil Spring-Rice could even now come forward to the aid of Indians. He might at least induce Washington to agree to Indian immigration being limited to "a gentleman's agreement," as is the case with the Japanese.

The American Review of Reviews writes that the United States Immigration Bill contained a Japanese exclusion clause.

This was highly offensive, because the Japanese Government had agreed with President Roosevelt and Secretary Root to regulate Japanese migratory labor in such a way as to meet American wishes. That agreement has always been faithfully observed. It is regrettable that Ambassador Chinda should have had to work so hard at Washington to prevent the enactment of an exclusion law. The Senate Committee last month agreed to change the bill in such a way as to make the exclusion apply to other Oriental regions but not to the latitude and longitude of Japan. The Senate will doubtless adopt the view of its Committee on Immigration, and it is to be hoped that the House will accept the amendment.

Leading Indians in America have done their best to safeguard the interests of their people, but in vain. Our readers are aware what Dr. Sudhindra Bose and others did. Recently Mr. Lajpat Rai has written an open letter to Senator Smith of South Carolina and other members of the Senate of the United States, in which occurs the following passage

"It is a gross injustice and, if I may be permitted to say, an outrageous reflection on the Hindus to be selected as the only people on God's earth who are to be excluded from entry into the United States as a race. It has been acknowledged by the highest scholastic authority in the world that the Hindus are from the Aryan stock; that their ancient language Sanskrit and many of their present spoken languages belong to the Indo-European branch of languages, and that they are the inheritors of a great and noble literature and civilisation. In fact, of all the peoples inhabiting the Continent of Asia, they are with the Persians and Caucasians the nearest of kin to the majority of the inhabitants of the United States. Their exclusion as a race is not only an ~~undeserved~~ and unjustifiable reflection on their national honour, but is equally unworthy of the high-mindedness of the great nation which stands for equal opportunity and open door for the meanest of God's creatures on earth.

Other persons may be excluded because they are ineligible for citizenship or for other reasons, but the Hindus (that is to say, the natives of India) are to be excluded because they are Hindus! The reason is quite obvious. The Japanese have to be shown at least some respect, because they are a self-ruling people and able to retaliate in some way or other. We are not self-ruling, and, as such, cannot bring any pressure to bear upon the Americans through our government. It has, in fact, been said that the representative of the British Government in the U. S. A. has been utterly apathetic to the appeals for help in this matter made to him by the Hindus in America. It has even been hinted, with what truth we are not in a position to ascertain, that he has been hostile to Hindu interests. Hindus who have not been in America for more than five years may under the new law be deported. Mr. Lajpat Rai urges that those who may be thus deported should be allowed to go to any country they choose; they should not be necessarily deported to India. For here they may be proceeded against for any political opinions they may have given expression to. It is a noble tradition of England and other politically free countries that they give refuge to men who may not be able for their political opinions to live in safety in their own country. But it seems, in the case of a "subject race," this tradition is not to have any meaning.

There are not sufficient facilities for education in India. When Indian students go to England they are far from welcome. It is difficult for them to enter educational institutions. More often than not they

are treated as suspects. Passports are getting increasingly difficult to obtain. A new Law of Manu of British origin would seem to be on the anvil, standing in the way of Indians crossing the *Kala Pani*. Under the new American Immigration Law students are to be required to execute bonds. At present some Hindu students are self-supporting. The new law might be able to make a clean sweep of them. We hope some of our friends in America will tell us how matters exactly stand, and under what conditions skilled workers, unskilled laborers, traders, travellers and students from India can go to America and live there as long as may be necessary.

As in things which rot, so among people who rot in their home countries and cannot go abroad, there is sure to be fermentation. This does not make for the health of an empire or a nation, or of humanity at large. A remedy must be found. We must not and do not give way to pessimism.

The U. P. Hindu Conference.

Though convened at short notice, the Hindu Conference at Benares has been a great success. The gathering was representative of the intellectual and material wealth of the province, and the sober and reasoned pronouncements made, supported as they were with incontestable facts and figures, ought, therefore, to carry weight. The position of the Hindus of Agra and Oudh in the Legislative Council, the District Boards, and the Municipalities, is indeed precarious; and no self-respecting community which understands its welfare can or ought to put up with it. A united nation, no doubt, requires that all communities should share in the power of self-rule, but it cannot mean that the community which is numerically preponderant and not deficient in other respects is to be humiliated and reduced to a position of impotence. We admire the energy, the spirit, and the persistence with which the U. P. Hindus are carrying on their struggle for civic rights.

The following table taken from Mr. C. Y. Chintamani's speech will give our readers some idea of the respective position of the Musalmans and the Hindus in some U. P. Municipalities:—

Municipality.	Percentage of Mahomedan to non-Mahomedan voters.	Percentage of Mahomedan to non-Mahomedan members.
Hathras	2.03	20
Barcilly	54.35	90
Meerut	59.03	87.5
Bijnor	70.57	125
Sitapur	47.46	50
Muzaffarnagar	38.22	66.6
Gorakhpur	57.55	66.6
Sahaswan	85.68	150
Sandila	70.52	125
Kalpi	19.10	50
Allahabad	24.13	61.54
Balrampur	33.76	66.6
Etah	38	60
Bela (Partabgarh)	35.16	50
Jhansi	20.03	40
Bahraich	73.77	120
Jalesar	44.11	50
Ghazipur	54.69	62.5
Hapur	47.53	66.6
Kunch	16.46	40
Koil (Aligarh)	38.27	71.43
Cawnpore	29.03	52.6
Rurki	38.49	50
Fatehpur	67.13	80
Chandausi	8.46	50
Sambhal	118.33	175
Orai	39.46	50
Mainpuri	10.46	33.3
Shahjahanpur	39.37	140
Fyzabad	23.05	55.5
Khairabad	73.33	150
Ujhani	26.88	50
Farrukhabad cum-Fatehgarh	14.13	62.5
Nagina	108.91	200
Tilhar	50.98	125
Kashipur	12.22	66
Shahabad	73.6	80
Tanda	98.42	150
Chandpur	134.55	200
Sultanpur	41.04	57.1

There are 84 municipalities in the province. The speaker was able to get figures for 64. Out of these, "it is only in 9 that the representation which the Mahomedans have got is somewhat less than what they would be entitled to according to their voting strength."

Communal Representation.

The evil effects of communal representation on local bodies have been officially admitted in the Panjab. A similar opinion has been expressed by the Bombay Government. That government appointed in August of last year a committee for the purpose of reporting what changes it was desirable to effect in the constitution of the District and Taluk Boards in the Presidency and their system of administration. In the official resolution on the report of this committee occurs a para-

graph in which it has been declared that the Government of Bombay are not in favour of communal representation on local boards, and will not sanction it except for strong reasons. On this India observes, quite justly,—

This decision is in conformity with the attitude which the Bombay Government has always taken up, and in striking contrast to the manner in which the Lieutenant-Governor of the United Provinces has dealt with this vexed question. Sir James Meston, while professing to be opposed personally to communal representation, pleaded that the Local Government were bound by the decision of higher authority. The public naturally wish to know how it is that the Government of Bombay can declare publicly that they adhere to their determination not to grant communal representation, while the Lieutenant-Governor of the United Provinces should put himself forward as a victim of *force majeure*. As a matter of fact, no "higher authority," has ever committed itself on the matter of communal representation on local bodies.

Advocates of separate and more than numerically proportionate representation for particular communities do not understand, or, if they do, forget, that no Indian community, however favoured by the bureaucracy, can attain the height of power and prosperity, unless the country be self-ruling; and the country cannot be self-ruling unless there is national solidarity. National solidarity, again, is impossible unless one gives up the endeavour to aggrandise one's own group in favour of the strengthening of the whole nation. As soon as a community thinks that it is more important than the others, or that it has political interests different from those of others, it creates a barrier between itself and others. Now, not only must such fresh barriers be not created, but strenuous efforts must be made to knock down the already existing barriers created by caste, creed, &c. No community ought to do or say anything which wounds the self-respect of other communities. If any such thing is said or done, love is lost between the different communities, and national solidarity becomes hard to attain. Representatives of the people ought to be judged by their work for public good, not by the creeds they profess. One could name Musalman members of council who have done more for the good of the public (including Hindus) than some Hindu members, and one could name Hindu members who have done more for the welfare of the public at large and of

Musalman in particular than some Musalman members.

Mahomedans have already got communal representation, and the Indian Christians have made a demand for it; and the present Viceroy has made a "sympathetic" response. Mahomedans base their claim to separate and excessive representation on, among other things, their superior political importance. We do not know on what considerations the Indian Christian demand is based. As the vast majority of the present-day Musalmans of India are not the descendants but only the correlative of the former Musalman conquerors of the greater part of India, so the Indian Christians also are the correlative of the "conquerors" of parts of India and the present rulers of British India. The political importance of Mahomedans is said to arise also out of the existence of a few independent Mahomedan States. But there is a larger number of independent Christian States. So, in this respect too, Indian Christians are a "politically superior" group. The Sikhs, the Mahrattas, and the Rajputs can also to some extent claim political importance, as they were in former days the independent rulers of parts of the country, and even now are rulers of states under British paramountcy; but the Mahrattas and Rajputs have not made any such claim. The European merchants have already got the franchise, to an extent out of all proportion to their number and even to their contribution to the revenues of the State. Apart from their mercantile or manufacturing character and interests, they are clamouring for more and separate representation on general grounds. So Government have to meet the excessive demands of Europeans, Musalmans, Indian Christians, and Sikhs; and there may be others who may come forward to make a similar claim based on some fact or fiction. The Hindus, who, in spite of the manipulation of census figures and classifications, still form the majority of the population of India, have yet to claim separate representation, and they may be driven to do it. But what would remain for these *inferior* specimens of Indian humanity after meeting the "just" and excessive demands of those who do or may claim to be the supermen of India? This is a question that sorrow

bids us ask, not anger. Alas, even if all the legislative council members, municipal commissioners, district and local board members, deputy magistrates and deputy superintendents of police and certain other classes of officials were drawn from the Musalman, or Christian or Sikh communities, and if they were all made Nawab Bahadurs, Sardar Bahadurs, or Rajas, Indians (*including* these communities) would still remain the most powerless and most despised among the "civilized" peoples of the earth. Of all races on earth, the American Immigration Law excludes the people of India alone by name, *because they are Indians*. No exception has been made in favour of Indian Musalmans, Indian Christians, or Sikhs. It is a copy-book maxim, but it is absolutely true, and ought to bear repetition, that, *united we stand, divided we fall*.

No community in India, large or small, standing alone, can be said to be morally, materially and physically capable of making and keeping India self-ruling, powerful, prosperous and enlightened. Is there any single community which has produced the most original thinkers, the best poets, the greatest scientists, the boldest and most resourceful captains of industry, the most enterprising merchants, the most democratic, courageous, unselfish and pure-hearted social reformers, the most catholic-minded and spiritual religious teachers and leaders, the most sagacious, well-informed and far-seeing statesmen and the most valiant warriors? We have developed along different lines, and supplement one another's deficiencies. Mere self-interest, if not anything higher, ought to lead us to keep together and seek the common good; nothing can be good for a part which is not good for the whole.

As a matter of compromise, patriots can go as far as separate and strictly proportionate representation for all communities, though this, too, is mischievous; and one does not know where to stop. If separate representation be given to sects, why not to sub-sects, or to castes, or to sub-castes, or to linguistic groups? That way chaos lies.

Bengali Soldiers.

It is not necessary to make any prophecy regarding the success or failure of the attempt that is being made to recruit and enlist a double company of Bengali

soldiers. But this can be said with some degree of certainty that if, when two years ago hundreds of Bengali young men offered to go to the front as fighters, cold water had not been poured on their ardour and their offer rejected on the absurd ground that they were untrained men and training would take time, and if, again, the second batch of the Bengal Ambulance Corps had not been disbanded after months of waiting without any reasons being publicly and plainly stated, men could have been by this time found to form several double companies. Let us, however, hope the attempt will succeed.

It is not generally admitted by Europeans that Bengalis were ever given to fighting. But the Nairs of the Malabar coast are admitted to have been good soldiers not very long ago. And yet, it is said, only 300 Nairs have offered to enlist as soldiers. It has been decided that Eurasian soldiers are to be placed on a footing of equality with those of British birth as regards pay, prospects and privileges. And yet what is the result? An Associated Press telegram says:—

BOMBAY, August 23rd.

The figures of Anglo-Indian recruiting in the Bombay Presidency so far are not quite encouraging. Bombay city could not muster more than 110 offers from young Anglo-Indians. Of these 32 withdrew and 30 were declared medically unfit. The remainder of the presidency, including Karachi and Baluchistan, has produced only 55 enlistments. Some sixty-five more are required to complete the presidency's quota.

These facts should be borne in mind by those British journalists in India, who are commenting on the lack of enthusiasm for recruiting observable in Bengal and are already indulging in some cheap ridicule in anticipation of the failure of the effort to enlist Bengalis as soldiers.

The Pay of Indian soldiers.

The question of the pay of the Indian soldier has been raised in connection with the Bengali recruiting movement. We think the question should be dealt with as it affects all sepoys, not as it affects or may affect the actual or prospective soldiers of any particular province or race. In Bengal, it is quite usual for menials to get Rs. 10 as monthly wages, and they earn another equal amount. Therefore, the Sepoy's pay of Rs. 11 per mensem and extra allowance of Rs. 3 or 4 cannot be much of an inducement in Bengal to follow soldiering as a profession. The literate

Bengali young man who will become a soldier will do so from love of adventure or similar motives.

The Bengali recruits to the French army have been given equal pay and privileges with French soldiers. Eurasians, who have got no martial fame or traditions to equal those of the Sikhs, Pathans, Gurkhas, &c., have got the same terms as British soldiers. So justice, consistency and sound statesmanlike policy require that the question of the Sepoy's pay and prospects should receive earnest consideration.

This is necessary on economic grounds, too. Mule-cart drivers and coolies are required for Mesopotamia. An appeal has been published in the *Pioneer* for their recruitment. These men are to be stationed at Basra, several hundred miles from the actual scene of fighting. So there is no risk of their losing their lives or limbs in battle; they will be engaged in making roads, lines, houses and go-downs. Let us now compare what they are to get and what Indian soldiers get. Their monthly wages will be Rs. 15 *with everything else found*. This shows that the eleven rupees, *plus* an extra allowance of Rs. 3 or 4, paid monthly to the sepoy for very risky work is less than what is offered to the laborer for doing work which is not risky. So on economic grounds we urge that the sepoy's pay be increased and made equal to that of the Eurasian soldier.

Brahman and Non-Brahman.

Some men in Southern India have raised the cry that, because there is not a good understanding there between Brahman and non-Brahman, because the Sudras and the Pariahs are despised and often insulted, persecuted and treated as not-human or sub-human, therefore there can be no self-government in India. We consider the insolent caste-spirit utterly abominable. We think it is partly because we had and still have pariahs among us that we have become pariahs among the races of mankind;—those who cannot respect the manhood of others must in course of time lose their own manhood and be treated as less than men. But however much we may hate caste, we must not theorize and dogmatise in opposition to the evidence of past and contemporary history. Were there not helots in Greece, and were there

not republics in that country at the same time; and is not republicanism a most advanced form of self-rule? Were there not slaves in the ancient republic of Rome? Were not the plebians of Rome at first a despised and powerless class, who gradually struggled upwards to civic recognition and power? The United States of America is at present the greatest democracy in the world. And yet in the past and present history of the treatment of the Negroes of that republic by its white citizens one can find a parallel and often worse than a parallel to the wrongs inflicted on the so-called "untouchables" of India by the so-called "touchables." More than once caste in America has been discussed in these pages. And Mr. Lajpat Rai, who is as sincere a Home Ruler as he is a sincere social reformer, has devoted many pages of his latest work to this subject. What strengthens the case of the Indian Home Ruler is that the Negro is gradually making headway in all directions and that because he lives in a democracy and is able to make use of democratic methods.

There are and may be sincere Indian opponents of Indian Home Rule. But, not unoften, in bringing forward arguments against self-rule, snobbish and servile men have the temptation of being patted on the back by Anglo-Indian journalists and other Anglo-Indians. All self-respecting and sensible Indians ought to scorn such patting on the back. First the approbation of one's own conscience and then, if any other support were needed, the approbation of the self-sacrificing servants of the Mother, ought to be quite sufficient for us.

There are immense difficulties in the way of winning Home Rule. All those social and other drawbacks which are urged as reasons why we ought not to have self-rule, existed and still exist, in a greater or less pronounced form, in self-ruling countries, and it is by the power of self-rule that these have been and are being removed. No self-ruling country is peopled entirely by perfectly wise, perfectly just, and perfectly angelic persons.

It is easy for the non-Brahman to speak of the Brahman's touch-me-not-ism. But is there no Western touch-me-not-ism towards Indians, whether they be Hindus or Musalmans, Brahmans or non-Brahmans? Why cannot Europeans travel

with Indians in the same railway carriage? Why are there reserved compartments for them? Why are not Indians allowed to build and own houses in certain favoured spots in some health and pleasure resorts in India? Why are not Indians allowed to walk or drive along certain roads or enter or sit in certain spots in some public places in India? Why are the doors of Anglo-Indian clubs generally shut against the best and highest Indians? Why are all the highest appointments and most of the higher ones in India forbidden fruit to Indians, however able they may be? Why do the British colonies exclude Indians? Why are footpaths and the best market-places reserved for whites in many a south African town? Why does the U. S. A. exclude the people of India by name? Why is it difficult for Indians to obtain passports for going to foreign countries? Why do educational institutions in Great Britain look askance at Indian students and only some of them very reluctantly and partially open their doors to them?

And, for many of these disadvantages, insults and wrongs, is there any effective remedy but self-rule?

It is only shortsighted and foolish men who think that, because the bureaucrat ordinarily dispenses equal justice between Indian and Indian, and distributes petty appointments, and also very astutely a very few high ones, to Brahmans and non-Brahmans alike, therefore there cannot be a better system of administration than the bureaucratic one. The saying about the beam and the mote needs to be remembered. It was no doubt selfish and inhuman for the old social legislators to consign a class of men to the position of "untouchables"; but is it angelic to practically treat whole countries and continents as if they were the abodes of "untouchables," as Europe and America seem bent on doing? If the submerged countries and continents still produce a few towering personalities, have not the pariahs, in spite of the crushing weight of Brahman sanctimoniousness, produced their saints whose images are kept and honoured in Hindu temples in southern India?

The bureaucratic form of administration may help to ameliorate the condition of the backward classes to a little extent and up to a certain point, but it is only

self-rule which can enable the entire Indian nation to make boundless progress and be equal to the most progressive nations in the world.

"Nānyah panthā vidyatē ayanāya."

The Cause makes the Fighter.

A great cause makes heroes of common men. The cause makes the fighter. By this we do not mean to say that a great cause can make even stocks and stones fight. What is meant is that there is enough heroism latent in common humanity in all countries, and a great cause calls it into play. A century ago Belgian valour was a term of reproach used sarcastically. But the enjoyment of liberty has made them so freedom-loving that they have fought most valiantly in the cause of independence. That they have not succeeded is another matter. The cause makes the hero; but success depends on resources and many other things. And it should not be forgotten that failure may often be marked by greater heroism than success.

Alike in civic and in military struggles, great causes inspire courage and faith and hope. If you despair of a people, give them a lawful and great cause to fight for, to struggle for, to live for; and see the miracle it can work. The cause of the freedom of small nationalities is a noble, a glorious cause; but it would be practically unmeaning to men who were not themselves free if they were not allowed to expect or claim freemen's rights for themselves without let or hindrance.

Antinarcotic Law in America.

In the course of a leading article, the *Lancet* comments on the working of what is known as the Harrison Antinarcotic Law in the United States of America. The writer remarks that the restrictions imposed by this Act are more severe than the regulations designed for the same purpose in any other country, and it was consequently feared that the new law would be followed by a large growth in the clandestine traffic in narcotic drugs. But a year's experience has dissipated this fear and the results have surpassed the most sanguine expectations. The writer proceeds:—

"A year's experience, however, has demonstrated not only that the Act was capable of smooth administration but that during the period in which it has been in force, there has been no sensible increase in

the smuggling of the class of drugs which the Act was designed to control. Some of the large wholesale dealers in drugs are quoted as saying that their sales of drugs of this kind have been reduced by 70 to 80 per cent. and retail traders seem to be agreed that the amounts supplied to the public have been materially restricted."

The distribution of opium, morphine and cocaine has been strictly limited to the quantities required for legitimate medicinal purposes.

The principal feature of the new legislation is the registration of doctors and druggists to enable them to prescribe or sell narcotic drugs. Pharmacists can obtain supplies only by ordering them on official forms and they can supply the drugs only to medical practitioners who write their orders on similar forms. Prescriptions, which must bear the patient's name and address, can be only for a definite quantity and have to be signed with the full name of the prescriber, whose address and registered number will also appear on the prescription. The prescription cannot be repeated, as it can be in India, and druggists will only supply on a fresh prescription. The authorities in America are at present considering the desirability of cancelling exemptions in favour of medicinal preparations containing even two grains of opium or half a grain of morphine.

Any one conversant with the state of affairs with regard to the almost unrestricted sale of narcotics in India will have felt that the evil has undoubtedly assumed alarming proportions. It is common knowledge that cocaine and opium are at the present time doing havoc among a certain section of the Indian people. Opium in pretty large quantity can be purchased by any one and cocaine can be prescribed by any doctor irrespective of his qualifications. In India we have the further difficulty with regard to *bhang* and *ganja*, and those conversant with the criminal history of the country will testify how the most heinous crimes are committed under the influence of the latter drug. The uncontrolled use of these drugs is not only undermining the health of the Indian people but is sadly undermining their morals. It was therefore high time that somebody raised the question of remodeling legislation on the subject in India. It is too much to expect the Government to take the initiative in matters in which a large sacrifice of revenue has to be made.

State versus Company Management of the Indian Railways.

It will be interesting to note in connection with the article on the subject which appears in another place in the current number of this *Review* that speaking on the Indian Railway policy at a recent meeting of the East India Association in Caxton Hall, London, Sir Guilford Molesworth, formerly Consulting Engineer of Railways, Government of India, said that he had always been an advocate of the Indian Railways being retained and worked by the State as instruments of development instead of simply creating revenue. He said he held that view as strongly as ever. Sir Muncharjee Bhownaggee, who was present at the meeting, gave a correct version of the views of his educated countrymen in stating with due emphasis that the Railways here should not be worked for the benefit of the companies, but for that of the people of India generally. We are, however, sorry to note in this connection that Sir Stephen Finney, C. E., for many years a Manager of State Railways in India and subsequently President of the Railway Board, as Chairman of the meeting expressed the opinion that, with the conditions now prevailing in India, the advancement of direct management by the State would not materially benefit the people while it would add to the burdens of the Government;—the same oft-repeated, old argument, which has been as repeatedly and effectively disposed of. But Sir Stephen Finney, who, we understand, on his retirement from the service of the Government of India, has joined the directorate of certain company-managed railways cannot now be expected to view things in their proper perspective and from the right angle of vision.

Railway Management.

In order to be able to solve the problem of railway management in India, one should bear in mind that it is not exactly identical with the problem of nationalization of railways *versus* management by private companies which people have to discuss in independent countries; for in India the nation and the State do not stand to each other in exactly the same relation as they do in independent countries. Here management by private companies practically means management by directors who are foreigners and by absentee capita-

lists. The profits go out of the country. The rates of railway freight have been fixed in such a way that they favour the import of foreign manufactured goods, to the disadvantage and detriment of indigenous industries. They also facilitate the export of raw materials for foreign manufacturers. The grievances of third-class railway passengers do not receive proper consideration, as their cries cannot influence the directors living in comfort at a distance of thousands of miles from India. In all these matters there is a greater chance of our being able to influence the Government of India than the foreign directorates of companies. Even if company management were more economical, what would it matter to us? It would only mean greater profits for foreign capitalists: whereas state management would bring at least some revenue to the public treasury, besides securing a few more posts with decent salaries to the children of the soil. If the personnel of the Government of India be in sympathy with indigenous industrial enterprise, much more can be done for the industrial development of the country under state management of railways than under foreign company management.

Nationalization of Railways in Japan.

It is interesting to note in this connection that before the year 1906 in Japan "anything like efficient co-operation was impossible" between private railway companies, "and constant complaints were heard about delays in transit and undue expense. The defects of divided ownership had long suggested the expediency of nationalization, but not until 1906 could the Diet be induced to give its consent. On March 31 of that year, a railway nationalization law was promulgated."

A Japanese appreciation of Sir Rabindranath Tagore.

The Herald of Asia, an English weekly paper conducted by Japanese, speaks of one of Sir Rabindranath Tagore's addresses in Japan as one "which will leave a deep and lasting impression upon the minds of the Japanese people. He touched upon subjects connected with the very essence and meaning of human life and history, and for a space of nearly an hour he held his audience spell-bound."

As may have been expected, the great Indian prophet is fearless and unreserved in exposing the materialistic and political aspect of European civilization in all its ugliness. Nothing, for instance, could be more plain speaking than the following:—

The political civilization which has sprung up from the soul of Europe and is overrunning the whole world, like some prolific weed, is based upon exclusiveness. It is always watchful to keep at bay the aliens or to exterminate them. It is carnivorous and cannibalistic tendencies, it feeds upon the resources of other people and it swallows their whole future. It is afraid of the eminence of other peoples, and it tries to keep its greatness outside its own boundaries, forcing other peoples who are weaker, to be eternally fixed in their weakness. The political civilization is scientific, not human.

The Herald of Asia hastens to add that "Tagore of course is not unconscious of Europe's greatness; far from it, he pays her no unstinted tribute."

He does not hesitate to express his hearty love and deep admiration for "the Europe who, in her literature and art, is pouring an inexhaustible cascade of beauty and truth fertilizing all countries and all time; the Europe who, with a mind which is titanic in its untiring power, is sweeping the height and the depth of the universe, winning her homage of knowledge from the infinitely great and the infinitely small. ... Such true greatness must have its motive power in spiritual strength. ... There, in the hidden heart of Europe, runs the purest stream of human love, of love of justice, of spirit of self-sacrifice for higher ideals. The Christian culture of centuries has sunk deep in her life's core." Nor is the Indian poet oblivious of the fact that there have from time to time risen in Europe "noble hearts who have ever stood up for the rights of man irrespective of colour and creed; who have braved calumny and insult from their own people in fighting for humanity's cause and raising their voices against the mad orgies of militarism. ... These are there to prove that the fountainhead of the water of everlasting life has not run dry in Europe, and from thence she will have her rebirth time after time."

So, in the poet's opinion, the greedy, aggressive and overbearing tendencies of European civilization are things of only the present, and he has no doubt but that a time will come when Europe will wake up and feel need of fresh confidence and strength that only come from spiritual purification.

In the opinion of the poet, meanwhile the apparently stationary East has not been dead but "has achieved something which is a positive truth—a truth that can give man's heart its shelter and sustenance. It has evolved an inner sense—a sense of vision, the vision of the infinite reality in all finite things." Summing up, *The Herald of Asia* says: "The East has, therefore, something to offer when Europe halts in her mad career of materialistic aggrandizement and yearns for spiritual sustenance." As the poet said in his address,—

The East with her ideals, in whose bosoms are stored the ages of sunlight and silence of stars, can patiently wait till the West, hurrying after the expeditious, loses breath and stops. The East knows that she is immortal, and she will appear again and again in Man's history with her draught of life.

The Herald is right in inferring that "the great Indian seer" is not satisfied with "the existing state of affairs in the East, or more exactly in India. Reading between the lines, it is obvious that he inwardly yearns for the time when, like Japan, 'not hampered from the outside,' India may be allowed to work out her destiny under the invigorating influence of a free and unfettered existence."

The Japanese paper then quotes the following concluding passage of the address,

"In this task of breaking the barrier and facing the world, Japan has come out the first in the East. She has infused hope in the heart of all Asia. This hope provides the hidden fire which is needed for all works of creation. Asia now feels that she must prove her life by producing living work, she must not be passively dormant, or feebly imitate the West, in the intimation of fear or flattery. For this we offer thanks to this land of the rising sun and solemnly ask her to remember that she has the mission of the East to fulfil. She must infuse the sap of a fuller humanity into the heart of the modern civilization. She must never allow it to get choked with the noxious undergrowth, but lead it up towards light and freedom, towards the pure air and broad space, where it can receive, in the dawn of its day and the darkness of its night, heaven's inspiration. Let the greatness of her ideals become visible to all men like her snow-crowned Fuji rising from the heart of the country into the region of the infinite, supremely distinct from its surroundings, beautiful like a maiden in its magnificent sweep of curve, yet firm and strong and serenely majestic."

and observes :

In the above quoted passage there is set before us Japanese a mission of transcendent significance. We cannot but feel misgivings as to our qualifications for a task of such supreme responsibilities, although there will never be any lack of determination and ambition on the part of this people to direct its endeavours along the line so eloquently indicated. In any case we could not, even if we wished, prove false to the ideals of Asiatic civilization—ideals which we are proud to share with the peoples of India and China and other countries of the continent. In this respect all peoples of Asia are bound together by ties that lie deep in the sub-conscious domain of their life and aspirations—ties, therefore, that they cannot break without doing violence to their very nature. The spiritual solidarity of Asia is a reality full of promise for the future course of history and civilization. That solidarity is a force that makes for peace and progress not only among the different peoples of Asia but between them and the peoples of the West, for it rests upon ideas essentially peaceful and humane.

The Japanese press and leaders are not, as was to be expected, unanimous in their estimate of the Poet's teachings, warnings and admonition. There has been criticism as well as appreciation.

Sir Rabindranath Interviewed.

A special correspondent of the *Manchester Guardian* writes to that paper from Tokio :

Sir Rabindranath Tagore, who is now in Tokio, has had an extremely cordial reception in Japan, which has a significance more than literary and more than personal, for it is one of the many indications of the growing intimacy between Japan and India and of the evolution of a new Asia awakening to a consciousness of unity.

The correspondent says :—

“In a brief address at Osaka he had touched, in a fashion perhaps not wholly gratifying to the New Japan, upon Eastern and Western civilisation. I reminded him of that, and asked him to elaborate his ideas.

Japan and Western Civilisation,

“Japan,” he said, “is rapidly acquiring the mechanical apparatus of Western civilisation, but I think it would be a grave misfortune if she cut loose from her own ideas and her own past. We have been through the same phase in India. When Western civilisation and Western education came to us they exercised a great fascination upon our youth, and for a time our own thought and our own traditions seemed to them worthless and fit only to be cast aside. Then came a reaction perhaps as extreme in the one direction as that in the other, and action and reaction are at work to produce an adjustment, for an adjustment is necessary. I have not been in Japan sufficiently long to say whether this is happening here also, but I feel it must be so. The Western apparatus which Japan has borrowed is like a garment rather than part of the individual himself. It is universal and external. True, the West has taken a long time to evolve it, but it has no peculiar character of its own, and the East can borrow it and transplant it rapidly. Precisely for that reason it cannot of itself satisfy the soul of a nation. Thoughtful men in Japan with whom I have talked tell me that they are conscious of this, that they feel the need of harmonising Japan's present with her past, and it is this feeling, I believe, which explains the extreme cordiality with which I have been received.”

Difference between the Eastern and the Western outlook.

“You ask me to characterise the difference between the Eastern and the Western outlook. That is very difficult, although the difference is very real. In the East we are conscious through all individual things of the infinity which embraces them. When I was in England I felt there was an incessant rush of just individual things upon me; it was not a question of noise and bustle and haste only, but the whole atmosphere lacked the sense of infinity. Upon me it had the effect of hampering reflection and meditation. No, I should not describe the difference as one between spirituality and materialism, though that is the way it is often put. I have known too many noble and devoted men in England who practise renunciation and self-sacrifice and strive for humanity, to deny your Western civilisation spirituality. No country could stand the shock of this war if it lacked spirituality. But it is a different kind from ours. It is not penetrated, as is ours, with the abiding sense of the infinite.”

The Eastern outlook and the Mechanism of Western civilisation.

“Do I think that Eastern thought, the Eastern outlook can be reconciled with the mechanism of Western civilisation? I think it can and must be. In the East we have striven to disregard matter, to ignore hunger and thirst, and so escape from their tyranny and emancipate ourselves. But that is no longer possible, at least for the whole nation. You in the West have chosen to conquer matter, and the fine task of science is to enable all men to have enough to satisfy their material wants, and by subduing matter to achieve freedom for the soul. The East will have to follow the same road, and call in science to its aid.”

The poet has no fear that the whole world will become uniform in thought and outlook. Of course he would not say offhand whether the characteristic outlook of nations was a matter of race.

“I know that in England my thoughts were not free, and I had to return to India for them to acquire their freedom. The colour of the sky, the air, the soil, all colour and shape thought, and help to make the philosophy of one nation different from that of another. Though I look forward to science and the mechanical arts of civilisation becoming a common possession of the whole world, I have no fear that the mind and soul of the whole world will become uniform, for these things are external like a garment, and do not touch the inner core of a people. I conceive a kind of federation of nations, in which each contributes its own characteristic philosophy.”

On the question of Japan's “mission,” or rather ambition, to unite and lead Asia, the Poet observed :—

“It does not surprise one to hear that Japanese think it their country's mission to unite and lead Asia. The European nations, for all their differences, are one in their fundamental ideas and outlook. They are like a single country rather than a continent in their attitude towards the non-European. If, for instance, the Mongolians threatened to take a piece of European territory, all the European countries would make common cause to resist them. Japan cannot stand alone. She would be bankrupt in competition with a united Europe, and she could not expect support in Europe. It is natural that she should seek it in Asia, in association with a free China, Siam, and, perhaps, in the ultimate course of things, a free India. An associated Asia, even though it did not include the Semitic West, would be a powerful combination. Of course that is to look a long way ahead, and there are many obstacles in the way, notably the absence of a common language and the difficulty of communication. But from Siam to Japan there are, I believe, kindred stocks, and from India to Japan there is much of religion and art and philosophy which is a common possession.

Not having a first-hand knowledge of Japan's mission or ambition,—having to look at Japan through British and American eyes, we cannot exactly say how and with what object she wishes to unite and lead Asia. Has she in view a federated or an imperialized Asia? In military and naval power, and in commerce and indus-

try, she is already the foremost country in the East. In things purely of the intellect and the spirit she is not.

In comparing Japan's progress with that achieved by India the poet could not but criticise both England's action and inaction. The Poet is not a biased critic; as he has said, "the problem of history in India is not to throw off England, but to make England's relation to ourselves living and natural."

"The Japanese have made remarkable progress, but, given equal opportunity, India would do as well. We are not inferior intellectually to the Japanese. Probably in the crafts we are so, but we are superior in pure thought. They have been free to educate themselves and to send their young men to all the universities of the world to acquire knowledge. But every Indian feels, and every candid student of India must admit, that you have conceived it to be to your interest to keep us weak and have discouraged education. In the laboratories you dislike us to acquire science and to pursue research.

"The Tata Foundation is an illustration. Here at last, we thought, India's opportunity had come. But the Government has taken control of it and killed it, and that splendid gift is now barren and worthless. The war comes, and you say to us: 'Industrialise yourself; make the things we need.' There is something ludicrous about this, for you have consistently and persistently striven to repress and cramp our economic development. It is hopeless for us to try to educate ourselves or develop ourselves. Your Government in India is so perfectly organised that you can render all such striving futile. But it is bad for you as well as for us. When one nation keeps another in subjection, when its authority is so perfect and complete that it can execute its arbitrary will with effortless ease, it saps its own love of liberty, its own vigour, its own moral strength. It discovers that when it comes into conflict with a virile nation."

It is not clear whether in the last sentence there is any reference to any fact of contemporary history, or it is a mere foreboding originating in a knowledge of the philosophy of history, and of human nature.

Congress Presidentship.

The Lucknow Congress Reception Committee has rejected by a majority of votes the recommendation of the majority of the Provincial Congress Committees that Babu Ambikatharan Majumdar should be chosen president of the next session of the Indian National Congress. The matter has, therefore, been referred to the All-India Congress Committee. It would have been well if this contretemps could have been avoided. As the recommendation of the majority of the Provincial Congress Committees has not been considered wise or morally binding, that of the All-India Congress Committee may share

the same fate. We do not know whether according to the Congress constitution the decision of the latter is binding or not.

Whoever may be chosen president should note that the country is no longer in a mood to tolerate safe pronouncements in favour of home rule or self-rule 500 years hence. Zeros being nonentities should be omitted.

New India security Forfeited.

The Madras Government has forfeited the security on *New India*. Such an event was foreseen by many. The order of forfeiture may be legal according to the law as it stands, but "legal," "equitable," and "just" are not synonymous terms. Nor is that which is "legal" necessarily wise or statesmanlike. This step was not necessary for the safety of India or the British Empire. *New India* has never been hostile to the British Empire idea; it has always insisted that it was absolutely necessary for the good of both India and Great Britain that they should remain together. The paper has, no doubt, been opposed to bureaucratic rule and has exposed its seamy side unsparingly. But that is neither high treason nor sedition.

It may be that Mrs. Besant will have ultimately to transfer her political activity from India to England, where there is plenty of work to do. In that country there is amazing ignorance of the character and condition of the people of India and of her government. This ought to be removed. Should Mrs. Besant or anybody else be prevented from carrying on the Indian Home Rule propaganda in the United Kingdom, it would not be a thing for Englishmen to felicitate themselves upon. For it would mean that the forces of absolutism which had restricted liberties abroad had begun to work havoc at "home."

Mr. Tilak gets a Passport.

The Bombay Government has given the necessary passport to Mr. Tilak to proceed to England in connection with the suit filed by him against Sir Valentine Chirol. We are glad.

We hope the Bombay Government has no power to bind Mr. Tilak to be of "good behaviour" in Great Britain. We hope it will be permissible for him to be a naughty boy there, and, as Britishers have a common saying, "Boys will be boys," his

naughtiness will not be considered as anything worse than mere boyish pranks, sixty years old though he be. For, there are among British statesmen many older boys than he, who, if their political opponents are to be believed, are very naughty, nay, wicked.

Mr. Tilak's voyage to England is expected to further the cause of social reform, and that would be a distinct gain. We are grieved that he cannot now be accompanied by his lawyer and life-long friend Mr. Daji Abaji Khare.

Daji Abaji Khare.

By the death of Mr. Daji Abaji Khare India loses a distinguished and patriotic public worker. *The Indian Social Reformer* says that he helped forward the Widow Remarriage movement and the movement for the passing of the Age of Consent Act. In the field of politics he belonged to the Moderate school. That, however, did not stand in the way of a life-long friendship with Mr. B. G. Tilak. What a blessing it would be if such friendships were commoner than they are.

For whatever names may be given to them, the servants of the Motherland are all one. It speaks much for the genuineness, breadth and intensity of Mr. Khare's patriotism that it could overleap party barriers and enable him to hug to his bosom a man of the so-called opposite camp of so strong and challenging a personality as that which Mr. Tilak possesses.

"Rally the Moderates."

In a contribution to the press by a respected British friend of India occurs the old mischievous cry, "Rally the Moderates." We call it "mischievous" deliberately, though we are sure the writer has not used it with any such intention.

The reason why we use this epithet is that it is a variation of the Machiavelian maxim of *divide et impera*. Indian politicians should never be induced to divide themselves into opposite camps by any sop thrown to them in the shape of a few high offices, or some petty changes in administrative machinery. The result of the "rally-the-moderates" policy adopted during the Morley-Minto regime is seen in the series of repressive measures passed during and since that period. The expansion of the legislative councils has been more than counterbalanced by that apple of discord yeapt communal representation.

Our united cry should be, "No more sops, please; we want the staple solid food of all progressive peoples, self-rule."

Bombay Protests.

Calcutta and Bombay have each claimed to be the first city in India. It is not our intention to decide between the rival claims. But so far as public activity goes, Bombay no doubt is now far more wide-awake than Calcutta, though Calcutta's recent record of domestic bickerings would be hard to beat. Bombay has, in public meeting assembled, protested against the Press Act, and has also protested against certain well-known clauses of the Government of India Consolidation Amendment Bill. The Indian Merchants' Chamber and Bureau of Bombay has addressed to the Government of India a protest against the non-representation of India at the Paris Conference, which concludes as follows:—

Under the circumstances stated above the committee of this Chamber fail to notice that there has been any change in the angle of vision, having regard to the fact of the studied exclusion of India from the Paris Economic Conference, whose decision is expected to lead to far-reaching consequences at the close of the war. While India, which along with the Colonies, has rendered and is still rendering yeoman's service to the Empire, is absolutely left unrepresented at the Conference, the Colonies are not only represented, but over-represented. If India has been so studiously excluded at this hour from the deliberations of the Paris Conference, what hope can the people of this great country have that their most vital interests on matters fiscal will be considered with anything like justice at the close of the war? The situation is indeed one which all India is justified on the facts here related to view with the greatest apprehension, if not alarm, and the committee respectfully appeal to the Government that they will take an early occasion to make a pronouncement.

Madras, Allahabad and Lucknow have also been recently more active than Calcutta.

Health of India.

The latest available birth-and-death rate figures per thousand for the different provinces are given in the table printed below. They are for the year 1915.

Province	Birth-rate	Death-rate	Infantile Mortality.
United Provinces	43.48	30.04	205.74
Bombay	37.10	26.12	172.00
Madras	31.19	21.97	186.53
Bengal	31.80	32.83	218.93
Bihar and Orissa	40.49	32.23	185.93
Assam	33.60	30.86	201.89
Central Provinces	47.95	35.91	259.72
Punjab	43.60	36.33	188.57
Burma	35.13	27.99	219.35
N.-W.F. Province	31.73	23.61	166.25
Delhi	48.35	29.22	220.89

Delhi has the highest birth-rate, and Punjab the highest death-rate. Madras has both the lowest birth-rate and the lowest death-rate. Judging by the excess of births over deaths, Delhi was the most healthy area during the year under report. But as it is comparatively easy to show a good record for a small and practically urban area, we should consider the United Provinces the healthiest region according to the standard adopted above. Bengal has been the unhealthiest province in 1915, as her death-rate has exceeded the birth-rate, which is the case nowhere else.

The comparative vital statistics of European countries for the latest available year, 1912, are given below.

Country.	Birth rate per 1,000.	Death-rate per 1,000.
United Kingdom	23.9	13.8
England and Wales	23.8	13.3
Scotland	25.9	15.2
Ireland	23.0	16.5
Austria	31.3	20.5
Belgium	22.6	14.8
Denmark	26.7	13.0
Finland	29.1	16.3
France	19.0	17.5
German Empire	28.3	15.6
Holland	28.1	12.3
Hungary	36.3	23.3
Italy	32.4	18.2
Norway	25.4	13.4
Prussia	28.9	15.5
Rumania	43.4	22.9
Serbia	38.0	21.1
Spain	32.6	21.8
Sweden	23.7	14.2

In India the highest infantile mortality was in the Central Provinces and the lowest in the North-West Frontier Province. But the lowest figure in India is much higher than the rate of infant mortality in many civilized countries.

Regarding the unhealthy condition of Bengal the Government resolution says :—

The outstanding feature of the returns of vital occurrences for the year 1915, is that, for the first time since 1892, the number of deaths in Bengal exceeded the recorded number of births. The excess amounted to 46,939 and was the result largely of widespread epidemics of cholera and small-pox, which caused altogether 163,461 deaths, and partly also of reduced vitality consequent on the adverse economic conditions and bad agricultural seasons of this and previous years. The decrease of population was not uniform and was in fact confined to the Presidency, Burdwan and Rajshahi Divisions, a continued increase being recorded in the Dacca and Chittagong Divisions with their prolific and prosperous population.

The three greatest foes of India are poverty, disease and ignorance, and there

is a very good understanding among these three powers. They help one another, and if you weaken any one of them, you may be able to weaken the other two.

Socially-enforced Widowhood.

The anniversary of the death of Pandit Iswar Chandra Vidyasagar has been recently celebrated in many places. But the cause for which his name stands does not seem to make much headway, particularly in the province of his birth. The tables in the Census Report giving the figures for widows make painful reading. There are not a few infants among them. Taking the whole of India the following tables gives the numbers of widows of the ages mentioned below :—

Age	Number of widows
0-1	866
1-2	755
2-3	1564
3-4	3987
4-5	7603
5-10	77585
10-15	181507

And among the nearly 20 millions of Hindu widows of higher ages, there must be a very large number who lost their husbands in infancy or childhood.

The re-marriage of child-widows has been advocated on moral, humanitarian and sociological grounds. In the following note we give some little-known facts to show that the lot of the widows requires amelioration.

Widows among the Jail Population.

The Musalman population of Bengal exceeds the Hindu by 32½ lakhs, Musalmans forming 52.3 and Hindus 45.2 per cent. of the total population. But of the convicts admitted into Bengal jails in 1915, 56.42 per cent were Musalmans and 40.22 per cent, Hindus. This shows that Hindus were not in 1915 more criminally inclined than Muhammadans. But when we consider the number and religion of the female convicts admitted during the year, we find that out of a total number of 702, so many as 322 were Hindus and 195 Musalmans. These figures become very significant when we remember that the total number of Hindu females in Bengal is 10,097,162 and that of Muhammadan females much larger, namely, 12,377,215. So though Musalman women outnumber Hindu women in the province, Hindu female convicts outnumbered Musalman female

convicts. Why? It cannot be because Hindus were more criminally inclined than Musalmans in 1915; in fact, as we have seen above, the truth lies the other way. Perhaps the following figures may throw some light on the state of things dwelt on above.

Among the 702 female convicts, 235 were married, 7 unmarried, 273 widows, and 187 prostitutes (among whom many must have been originally widows). Here widows outnumber any other class of women; but what is their proportion among the total female population of Bengal? Among woman in Bengal 75,60,825 are unmarried, 1,04,24,322 married, and, 45,16,902 widowed. So the smallest number is that of widows; but among female convicts, the largest is that of widows. This leaves no doubt that widowhood brings many temptations, trials and difficulties which lead to crime. And the reason why Hindu female convicts outnumber Musalman female convicts may be that in Bengal in spite of a larger Muhammadan population, there are among them 700,000 widows less than among Hindus.

Let us now turn to the Bihar and Orissa figures for 1915. Here the number of females admitted into jails during 1915 was 750. Out of these 336 were married, 22 unmarried, 361 widows and 31 prostitutes. In these provinces, too, the widows outnumber each of the other descriptions of female convicts, though the proportion of widows among the general female population of Bihar and Orissa will be seen to be the smallest from the following figures:—unmarried 5,386,311; married 9,028,628; widowed 3,215,216.

In the United Provinces, of the total female population, 6,887,907 are unmarried, 11,777,845 married, and 3,874,461 are widowed. Among female convicts admitted in 1915, the married numbered 863, the unmarried 17, and widows 420. Here though the widows do not preponderate, their proportion is much larger in jails than among the general population. Among the general female population their number is one-third of that of the married; but in jails it is one-half.

In the Central Provinces, unmarried females number 2,186,710, married 3,692,210, and widows 1,106,996. So the number of widows is less than one-third that of the married. But among female

convicts in 1915, there were 175 married, 7 unmarried, and 91 widows; that is to say, they numbered more than half of the married.

Thus in the four provinces of which alone we have the jail reports before us, widowhood is clearly seen to lead to crime.

Do pity the widows. Do help them to lead honest, useful, happy lives.

Illiteracy and Crime.

The figures given are for 1915.

In Bengal—

The number of convicts able to read and write was 10.92 per cent., able to read only 1.81 per cent., and illiterate 87.27 per cent.

In Bihar and Orissa—

The number of convicts able to read and write was 6.12 per cent., able to read only 1.80 per cent., and illiterate 92.08 per cent.

In the United Provinces—

5.47 per cent. were found able to read and write, 0.69 per cent. able to read only and 93.84 illiterate.

In the Central Provinces and Berar—

Out of a total of 4,895 convicts, 595 were able to read and write, 44 were able to read only, and 4,256 were illiterate.

On teaching Indian children.

The following extract from the *Pioneer Mail* contains much that is very wise and sane:—

The teacher, therefore, who proposes to instruct the small boys and girls of India should come to the task with the firm conviction that methods will have to be adapted to the peculiar surroundings and minds of his pupils, as distinct from those of the English child. They are, to a far larger extent than English children, men and women in miniature, with the dignity, reserve, and knowledge of life we associate with adults, and to my mind the first thing is to instil a more playful, childish, and fanciful view of life, to encourage games and jollity and a happy outlook, to allow a good deal of freedom of expression, for it is in this way that we can perhaps, to some extent, counteract the effect of listening to conversation quite unsuited, in English opinion, to childish ears, and replace the serious outlook of the grown-up by the candid thoughtless gaiety which is the charm of happy childhood."

"Behula Dancing at the Court of Indra."

The story of Behula, the subject of our frontispiece, was told in the first (January, 1907) number of this Review by Babu Dineshchandra Sen, B.A., Rai Saheb.

Behula is the heroine of the story of Manasa Devi, the goddess of snakes, and her great opponent Chand Saudagar, the merchant-king of Champak-nagar. Chand was a worshipper of the god Siva, who had ordained that until and unless Chand worshipped Manasa, her claims to obtain *pūja* amongst mortals would not be recognised. But neither by gentle persuasion nor by revengeful methods could she prevail upon the merchant to worship her. She reduced him to poverty, killed all his sons, so that the heart-rending lamentations of his six young widowed daughters-in-law filled his house. As the result of the ire of the goddess various other calamities befell him, but he remained firm in his resolve as before. It was predicted by the astrologers that his son Lakshmindra, born after the death of his first six sons, would die of snake-bite on the night of his marriage-day. He, however, had a steel-house made, taking precaution that there was no crevice left in it for even a pin to pass through. The house was, besides, guarded in every possible way from the approach of snakes. But Manasa worked on the fears of the engineer and compelled him to secretly make a small opening in a wall, which he kept stopped with powdered coal. On the night Lakshmindra was married to Behula, the young couple retired to that steel-house, and there the bridegroom died of snake-bite.

"The body of Lakshmindra was taken to the burning-ghat. But Behula insisted that her husband's body should not be burnt. The custom in the country in cases of snake-bite was to place the corpse on a raft made of plaintain trees called a *bhela* and leave it on the river, that perchance the skill of a snake-charmer or a physician might bring it back to life." Behula's arguments were appreciated and a raft was prepared and the corpse of the prince placed thereupon. When it was floated on the river, to the wonder of all assembled there, Behula got on the raft and there sat by the corpse expressing her determination to accompany her husband's body over the waters and not leave it until and unless it was restored to life. People thought she had lost her senses. But neither reproaches, nor taunts, nor entreaties could dissuade her. The raft passed swiftly down the stream. In course of time the corpse began to decompose. But still she sat there.

She washed and cleaned the corpse, she ate nothing, and when her grief was great she wept in her forlorn condition. "In dark nights the winds rose and crocodiles gathered round her raft eager to devour the decomposed body. Jackals came to carry it off when the raft came near the bank, but she was preserved by Providence from their attacks." "Six months passed in this way, the boat touched the ghat of Neta, the heavenly washer-woman, and Behula saw in the fine morning when she came up there, Neta washing clothes on the bank of the river Gangoor." She was prevailed upon to take Behula with her to heaven. "There in the high heaven Behula was ordered to dance before the assembled gods, and Behula did her part so well that the gods were mightily pleased with her, and Manasa was requested by them to restore Lakshmindra to life," which she consented to do.

Industrial Commission not meant specially for the benefit of Indians

At an informal conference with the Madras Chamber of Commerce, Sir Thomas Holland made a speech, in the course of which, as reported by the Associated Press,

Sir Thomas Holland took it for granted the Commission was in no sense a movement for the benefit of Indians as opposed to Europeans or "vice versa." It was intended to find out exactly in what direction there was scope for industrial development, regardless as to whether a European or an Indian undertook the work. He then referred to the part Europeans played in assisting the industrial development of the country in the past and the necessity of their continuing so for many years to come for the initiation of further industries, as Indians were less willing to devote their money to industrial development.

We have never been under any delusion as to the scope or object of the Commission. Sir Thomas Holland's statement serves to dispel any misconception which any one may have had. Indians should take note now, if they have not done so already, that unless Indian capitalists, industrialists and technological experts be up and doing and can take time by the forelock, the net result of the industrial commission will be the further and thorough exploitation of our resources of all kinds by foreign capital.

"A scheme for a large body of Chemists."

Sir Thomas Holland went on to say: One problem of the Commission was the creation of central technical departments which would

enable the Government to carry on where the Commission would leave off. A scheme might well provide the Government of India with a large body of chemists of all kinds. Such a central reservoir of chemists would be able to maintain a well-equipped laboratory and create a chemical atmosphere.

He is also reported to have observed that "Increase of research work led to industries being created even under unfavourable conditions in Europe. For instance, sugar, though a tropical industry, was imported by India from Germany and Austria." Should there be a scheme to provide the Government of India with a large body of chemists of all kinds, it is to be hoped that the services of qualified Indian chemists will be entertained. We have several such. For instance, there is Dr. Hemendra Kumar Sen, D. Sc. (London), who stood first in the first division in Chemistry (Calcutta University, 1911), and subsequently obtained the Premchand Roychand Studentship. He has obtained the Doctorate in Organic Chemistry of the University of London (1915). He has contributed many original papers based on his researches to many British and German Journals of Chemistry. Dr. Jocelyn Thorpe, D. Sc., F.R.S., Professor of Organic Chemistry, Imperial College of Science and Technology, writes of him:—"What I wish most particularly to emphasize is that he most certainly possesses the true research spirit combined with very considerable originality of thought. It is certain that this combination in conjunction with the sound knowledge of his subject which I know him to possess, will enable him to attain a high place among Organic Chemists in the near future." From what Dr. Thorpe says further, it is clear Dr. Sen is acquainted with some manufacturing processes and *has discovered one which has been of use to the Admiralty*. Dr. Thorpe writes:—

"After the commencement of the war Dr. Sen devoted his time to the elaboration of a process by which the valuable drug B Eucaine could be prepared in quantity and, at the request of the Admiralty, a considerable quantity of this material was made for them by his process."

Since returning home he has been engaged in elaborating a process for the production of dry, fat-free casein, the principal constituent of Sanatogen, and has obtained good results. It is a pity that the country does not possess

advanced colleges of science with research laboratories, or research laboratories connected with large manufacturing concerns, in sufficient numbers, to utilise and benefit by the expert knowledge of men like Dr. Sen.

A Mysore Deputation to Japan.

When Prof. C. J. Hamilton was sent to Japan by the Government of India to study economic developments there, we suggested that some competent person or persons should be sent by the people of India to Japan for the same purpose; for the official and the European points of view cannot, for obvious reasons, be the same as ours. We are glad to find an idea similar to ours has struck the Government of Mysore. That progressive state has decided to send a deputation of commercial men to Japan "to study the business habits of the Japanese people." The deputation consists of a few merchants and a few officials. We are sure the Mysore Government will instruct the deputation to study also all the methods and means of Japanese industrial development, including the kind and amount of Government encouragement to Japanese commercial and industrial enterprises. We have already some information on the subject in the Encyclopaedia Britannica and other standard works, and in Mr. Lapat Rai's articles in this Review. Prof. Hamilton has not so far made any helpful addition to our knowledge. He has spoken of the "energy and careful organisation" of the Japanese and "of the way in which the cottage industries of Japan are utilising every kind of raw material at their disposal for some kind of definite purpose." Should he add that the Japanese are an energetic people dwelling in a cold country and the Indians a lethargic people inhabiting a tropical country, we ought to be convinced that he had given us our money's worth.

The New Tagore Professor of Law.

It is a matter for satisfaction that Mr. Kashi Prasad Jayswal, M. A. (Oxon), Barrister at law, has been appointed Tagore Professor of Law for the year 1917. The subject of his lectures will be "Manu and Yajnavalkya—a comparison and a contrast." Mr. Jayswal is a competent Hindu jurist and scholar,

and will, we doubt not, be able to do justice to his subject. He possesses the power to think and interpret for himself, and to shape and give expression to bold and original views, thus striking out a path for himself out of the beaten track.

At the Calcutta University Senate meeting at which the appointment was made,

Mr. Archbold said that he understood that Government had some objection against Mr. Bose. Was that objection still in existence? Before they voted on the subject they were entitled to know whether the Government of India had expressed any opinion on the subject.

The Hon. the Vice-Chancellor said that they had no information on the subject before them.

Mr. Archbold: Then we cannot vote.

The Hon. the Vice-Chancellor: No one is called upon to vote if he has any objection.

Mr. Archbold: Then I oppose the motion.

The motion was then put to the vote and carried.

Mr. Archbold's opposition was not pertinent, as appointments to this particular professorship have never been subject to the previous approval of Government. The snubbing administered to him by the Vice-Chancellor was rather neat.

Famine in Bankura.

The poor people of Bankura seem now to be able to look forward to better days. The recent rainfall has improved the agricultural outlook, and if there be not an untimely cessation of rain there will be a bumper crop in parts of the district and a normal yield in the remaining portions. Help will have to be continued for a few weeks longer, which the Bankura Sammilani may be able to do in its relief-centres with the money left in its hands. As treasurer of the Sammilani, the Editor of this review warmly and sincerely thanks all the kind donors whose contributions have been the means of saving so many lives and relieving so much misery.

Bose Research Institute Studentship Fund.

The suggestion was made in these pages some months ago that the nation's admiration and appreciation of and pride in Dr. Bose's scientific discoveries should take the form of an Institute where further researches could be carried on by him, and a number of selected advanced students could receive guidance and training in research under him. We also suggested that these advanced students should be given Fellowships out of the proceeds of a fund raised for the purpose.

It is a pleasure to find that others have been thinking in the same way with us. The Institute itself, with laboratory, workshop, lecture-hall and an experimental nursery of plants, Dr. Bose is himself providing. The buildings are making rapid progress, and will soon be fit for use. We will not describe them and their adjuncts now.

Dr. Bose has done and is doing his part. The duty of the nation is to provide funds for the Fellowships. An appeal has been issued, influentially signed, to which we invite the serious attention of the princes and people of India, trusting that it will meet with adequate response.

AN APPEAL.

Prof. J. C. Bose has, by his researches, added greatly to the world's store of scientific knowledge. By his discoveries in many fields of science he has practically shown that, though knowledge is manifold, Science is One. In these days of excessive and restricted specialisation, this synthetic view of science is a great service rendered to its cause. Through their great philosophical insight, the sages of ancient India realised the one in the many of the universe. Prof. Bose, by rigorous scientific methods of strictly experimental demonstration, has demonstrated the underlying unity running through what is called the inanimate creation, and the vegetal and animal kingdoms; he has, in fact, largely demolished the walls that were supposed to divide the Living from the Non-Living. "In these remarkable investigations," says a leading scientific journal, "the synthetic intellectual methods of the East co-operate with the analytic methods of the West in a single mind."

Just as in the realm of pure science his researches have opened out new avenues of knowledge,—in Physics, in Physiology, and in Psychology,—so in the sphere of applied science, his discoveries have been considered by competent persons to be fraught with immense possibilities in the fields of Radiotelegraphy, in Medicine, and in Agriculture, some of which have already found practical application.

In modern times, the West leads the world in mechanical and scientific inventions. But even the West now acknowledges that, for the advance of many recondite branches of knowledge, the epoch-making instruments of unprecedented delicacy invented by Dr. Bose are essential.

And these have been made in India by Indian mechanicians trained by him under his special direction. This has proved that even in inventive genius and high mechanical skill India can win a pre-eminent place in the world.

The great service rendered by Dr. Bose to science has demonstrated that Indians are capable not merely of learning but also of teaching experimental science; it has also secured for our country the recognition from leading thinkers of the fact that the store of the world's knowledge will be incomplete without India's special contribution. It is not necessary to describe how this fact has raised India in the estimation of the intellectual world, and how it has stimulated the hope, the courage and the confidence of young India to render by their labours a world-service and thus revive the great traditions of the past.

In the modern realm of science Prof. Bose has boldly essayed to renew that spirit which from time immemorial animated our great ancestors in their never-ending quest to seek an underlying unity amidst bewildering diversity. Thus has been demonstrated the ever-inspiring fact that India has been able, all appearances to the contrary notwithstanding, to maintain a continuity of her line of seekers and sages.

This has naturally awakened a keen desire in the minds of many Indians that the pride we take in the achievements of our illustrious countryman and the gratitude we feel for his devoted services in raising our country in the estimation of the world should find an adequate national expression. The best form of this is, the establishment and perpetuation of a school of science to hold the meed of recognition which has been so hardly won by the great Indian scientist, and thus keep up a continuous tradition of India's special gift to the world in the realm of science.

For the accomplishment of this great object it is essential that there should be a properly equipped laboratory with its attached workshop, a lecture hall, and a band of advanced students devoted to science to be specially trained under Dr. Bose in his new methods of investigation. The life-long earnings of Dr. Bose have been offered by him for the building of an Insti-

tute where his researches will be continued by himself and his disciples, where his new inventions will be perfected and his new discoveries announced to the scientific world. The Government, in recognition of his contributions in advancing the world's science, has sanctioned a special allowance for five years for the continuation of his work. His old and recent students and other lovers of science have decided that the nation's contributions should take the form of giving opportunities to a dozen advanced students for obtaining a special training under Prof. Bose so that they may devote their whole life to the furtherance of research in the Institute. With this object in view it is proposed to institute twelve studentships of the minimum value of Rs. 100 a month each.

For this purpose it is necessary to collect such an amount as would yield sufficient interest for the payment of these monthly studentships. A Trust Deed* has been prepared, a copy of which is attached herewith. (* Omitted for want of space.)

To all who earnestly desire that science should advance and that India should occupy and maintain an honoured place in the realm of science by her special contributions, we appeal in the hope that there will be a large and adequate response.

History of Aurangzib

Based on original Sources

by Jadunath Sarkar

Vol. III. Rs. 3-8.

First Half of the Reign, 1658-1682.

CONTENTS :

* Members of royal family—High Officials—Foreign relations of India—Pro-Islamic and moral regulations—Sarmad beheaded—Shah Jahan's captivity and death—Conquest of Assam, Chatgaon, Palamau—Frontier Afghan wars—Repression of Hindus—Jaziya—Hindu risings : Jats, Satnamis—Growth of Sikh sect—Guru Govind's career—War with Rajputs—Raj Singh, Durgadas—Rebellion of Prince Akbar.

Works by Prof. JADUNATH SARKAR

History of Aurangzib.

2 vols, 730 pp., Rs. 3-8 each.

It is the only reliable and exhaustive history of India in the 17th century, being based upon original Persian sources, nearly all of which are in ms. and which no previous writer has used. In addition to the State papers of the Mugal empire and two Persian histories written by Hindus, the author has relied on more than 3,000 letters of Aurangzib and his contemporaries. All the Mass. available in the public libraries of Europe and India, besides several in private possession have been copied and utilised. Vol I. is a detailed account of half of the reign of Shah Jahan and describes Aurangzib's system of provincial government and his diplomatic and military preparations. Vol. II. is an exhaustive and original account of the War of Succession between Aurangzib and his brothers.

Anecdotes of Aurangzib and Historical Essays.

248 pp. Rs. 1-8.

CONTENTS : Life of Aurangzib (31 pp.),—Who built the Taj?—The Companion of an Empress (the life of a cultured Persian lady in the service of Shah Jahan),—The Wealth

of Ind in 1650,—Daily Life of Shah Jahan,—and of Aurangzib,—A Muslim Heroine (a woman who ruled the Afghans from 1677 to 1698),—Feringi Pirates of Chatgaon, (1660—Mugal conquest of Chatgaon),—Khuda Bakhsh (the founder of the celebrated library of Arabic and Persian Mss.)

"All the essays are brightly written, and several contain information not hitherto available to the English student." *Indian Antiquary.*

Chaitanya's Pilgrimages and Teachings.

338 pp., Rs. 2.

This is the only English translation of his contemporary biography, the *Chaitanya-charitamrita*; Madhya-lila. Readers ignorant of Bengali can here find the most correct account of Chaitanya's wanderings and preachings, his characteristic deed and sayings, exactly as known to his personal disciples. It incidentally describes the Hindu society of 1500 A. D. With a rare old portrait of the saint.

C. F. Andrews.—"The translation is lucid, clear and simple, and the book is remarkably well printed.....Gives the clearest picture of the Saint and his teaching, and is full of intense human interest from beginning to end."

Economics of British India.

3rd. Ed. thoroughly revised and enlarged,

pp. 336, Price Rs. 3.

This book gives, in one volume of manageable size, a complete account of India's physical features, economic products and resources, industries, transport facilities, currency, public finance, labour laws, land tenure systems and legislation, etc.

Sir Theodore Morison—An authoritative work on Indian economics can only be written by an Indian. The author of the present book appears to possess the further essential qualifications of courage and independence. "Most useful publication..... simply invaluable to the student of Indian economics and public questions." *Mahratta*. "Extremely useful hand-book of valuable information." *Hindu* "An indispensable vade mecum." *The Modern Review*.

THE SONG OF THE DEFEATED

My Master has asked of me to stand at the roadside of retreat
and sing the song of the Defeated,
for she is the bride whom He woos in secret.
She has put on the dark veil, hiding her face from the crowd,
the jewel glowing in her breast in the dark.
She is forsaken of the day; and God's night is waiting for her
with its lamps lighted and flowers wet with dew.
She is silent with her eyes downcast;
she has left her home behind her, from where comes the wailing
in the wind.
But the stars are singing the lovesong of the eternal
to her whose face is sweet with shame and suffering.
The door has been opened in the lonely chamber,
the call has come,
and the heart of the darkness throbs with the awe of the
expectant tryst.

RABINDRANATH TAGORE.

MY REMINISCENCES

BY RABINDRANATH TAGORE.

[ALL RIGHTS RESERVED.]

(30) *Evening Songs.*

IN the state of being confined within myself, of which I have been telling, I wrote a number of poems which have been grouped together, under the description of the *Heart-Wilderness*, in Mohita Babu's edition of my works. In one of the poems

subsequently published in a volume called *Morning Songs*, the following lines occur:

There is a vast wilderness whose name is *Heart*;
Whose interlacing forest branches dandle and rock
darkness like an infant.

I lost my way in its depths
from which came the idea of the title of
this group of poems.

Much of what I wrote, when thus my life had no commerce with the outside, when I was engrossed in the contemplation of my own heart, when my imaginings wandered in many a disguise amidst causeless emotions and aimless longings, has been left out of that edition; only a few of the poems originally published in the volume entitled *Evening Songs* finding a place there, under the *Heart-Wilderness* group.

My brother Jyotirindra and his wife had left home travelling on a long journey, and their rooms on the third storey, facing the terraced-roof, were empty. I took possession of these and the terrace, and spent my days in solitude. While thus left in communion with my self alone, I know not how I slipped out of the poetical groove into which I had fallen. Perhaps being cut off from those whom I sought to please, and whose taste in poetry moulded the form I tried to put my thoughts into, I naturally gained freedom from the style they had imposed on me.

I began to use a slate for my writing. That also helped in my emancipation. The manuscript books in which I had indulged before seemed to demand a certain height of poetic flight, to work upto which I had to find my way by a comparison with others. But the slate was clearly fitted for my mood of the moment. "Fear not," it seemed to say. "Write just what you please, one rub will wipe all away!"

As I wrote a poem or two, thus unfettered, I felt a great joy well up within me. "At last," said my heart, "What I write is my own!" Let no one mistake this for an accession of pride. Rather did I feel a pride in my former productions, as being all the tribute I had to pay them. But I refuse to call the realisation of self, self-sufficiency. The joy of parents in their first-born is not due to any pride in its appearance, but because it is their very own. If it happens to be an extraordinary child they may also glory in that—but that is different.

In the first flood-tide of that joy I paid no heed to the bounds of metrical form, and as the stream does not flow straight on but winds about as it lists, so did my verse. Before, I would have held this to be a crime, but now I felt no compunction. Freedom first breaks the law and then

makes laws which brings it under true Self-rule.

The only listener I had for these erratic poems of mine was Akshay Babu. When he heard them for the first time he was as surprised as he was pleased, and with his approbation my road to freedom was widened.

The poems of Vihari Chakravarti were in a 3-beat metre. This triple time produces a rounded-off globular effect, unlike the square-cut multiple of 2. It rolls on with ease, it glides as dances to the tinkling of its anklets. I was once very fond of this metre. It felt more like riding a bicycle than walking. And to this stride I had got accustomed. In the *Evening Songs*, without thinking of it, I somehow broke off this habit. Nor did I come under any other particular bondage. I felt entirely free and unconcerned. I had no thought or fear of being taken to task.

The strength I gained by working freed from the trammels of tradition led me to discover that I had been searching in impossible places for that which I had within myself. Nothing but want of self-confidence had stood in the way of my coming into my own. I felt like rising from a dream of bondage to find myself unshackled. I cut extraordinary capers just to make sure I was free to move.

To me this is the most memorable period of my poetic career. As poems my *Evening Songs* may not have been worth much, in fact as such they are crude enough. Neither their metre, nor language, nor thought has taken definite shape. Their only merit is that for the first time I had come to write what I really meant, just according to my pleasure. What if those compositions have no value, that pleasure certainly had.

(31) *An Essay on Music.*

I was proposing to study for the bar when my father recalled me home from England. Some friends concerned at this cutting short of my career pressed him to send me off once again. This led to my starting on a second voyage towards England, this time with a relative as my companion. My fate, however, had so strongly vetoed my being called to the bar that I was not even to reach England this time. For a certain reason we had to disembark at Madras and return home to Calcutta. The reason was by no means

as grave as its outcome, but as the laugh was not against *me*, I refrain from setting it down here. From both my attempted pilgrimages to *Lakshmi's** shrine I had thus to come back repulsed. I hope, however, that the Law-god, at least, will look on me with a favorable eye for that I have not added to the encumbrances on the Bar-library premises.

My father was then in the Mussoorie hills. I went to him in fear and trembling. But he showed no sign of irritation, he rather seemed pleased. He must have seen in this return of mine the blessing of Divine Providence.

The evening before I started on this voyage I read a paper at the Medical College Hall on the invitation of the Bethune Society. This was my first public reading. The Reverend K. M. Banerji was the president. The subject was Music. Leaving aside instrumental music, I tried to make out that to better bring out what the words sought to express was the chief end and aim of vocal music. The text of my paper was but meagre. I throughout sang and acted songs illustrating my theme. The only reason for the flattering eulogy which the President bestowed on me at the end must have been the moving effect of my young voice together with the earnestness and variety of its efforts. But I must make the confession to-day that the opinion I voiced with such enthusiasm that day was wrong.

The art of vocal music has its own special functions and features. And when it happens to be set to words the latter must not presume too much on their opportunity and seek to supersede the melody of which they are but the vehicle. The song is great in its own wealth, why should it wait upon the words? Rather does it begin where mere words fail. Its power lies in the region of the inexpressible; it tells us what the words cannot.

So the less a song is burdened with words the better. In the classic style of Hindustan† the words are of no account and leave the melody to prefer its plaint in its own way. Vocal music reaches its perfection when the melodic form is allowed to develop freely, and carry our conscious-

ness with it to its own wonderful plane. In Bengal, however, the words have always asserted themselves so, that our provincial song has failed to develop her full musical capabilities, and has remained content as the handmaiden of her sister art of poetry. From the old *Vaishnava* songs down to those of Nidhu Babu she has displayed her charms from the background. But as in our country the wife rules her husband through acknowledging her dependence, so our music, though professedly in attendance only, ends by dominating the song.

I have often felt this while composing my songs. As I hummed to myself and wrote the lines:

Do not keep your secret to yourself, my love,
But whisper it gently to me, only to me.

I found that the words had no means of reaching by themselves the region into which they were borne away by the tune. The melody told me that the secret, which I was so importunate to hear, had mingled with the green mystery of the forest glades, was steeped in the silent whiteness of moonlight nights, peeped out of the veil of the illimitable blue behind the horizon—and is the one intimate secret of Earth, Sky and Waters.

In my early boyhood I heard a snatch of a song:

Who dressed you, love, as a foreigner?

This one line painted such wonderful pictures in my mind that it haunts me still. One day I sat down to set to words a composition of my own while full of this bit of song. Humming my tune I wrote to its accompaniment:

I know you, O Woman from the strange land!
Your dwelling is across the Sea.

Had the tune not been there I know not what shape the rest of the poem might have taken; but the magic of the melody revealed to me the stranger in all her loveliness. It is she, said my soul, who comes and goes, a messenger to this world from the other shore of the ocean of mystery. It is she, of whom we now and again catch glimpses in the dewy Autumn mornings, in the scented nights of Spring, in the inmost recesses of our hearts—and sometimes we strain skywards to hear her song. To the door of this world-charming stranger the melody, as I say, wafted me, and so to her were the rest of the words addressed.

Long after this, in a street in Bolpur, a

* The Goddess of Wealth.

† As distinguished generally from different provincial styles, but chiefly from the Dravidian style prevalent in the South. *Tr.*

(33) *More about the Evening Songs.*

At this time my reputation amongst literary critics was that of being a poet of broken cadence and lisping utterance. Everything about my work was dubbed misty, shadowy. However little I might have relished this at the time, the charge was not wholly baseless. My poetry did in fact lack the backbone of wordly reality. How, amidst the ringed-in seclusion of my early years, was I to get the necessary material?

But one thing I refuse to admit. Behind this charge of vagueness was the sting of the insinuation of its being a deliberate affectation—for the sake of effect. The fortunate possessor of good eye-sight is apt to sneer at the youth with glasses, as if he wears them for ornament. While a reflection on the poor fellow's infirmity may be permissible, it is too bad to charge him with pretending not to see.

The nebula is not outside creation—it merely represents a phase; and to leave out all poetry which has not attained definiteness would not bring us to the truth of literature. If any true phase of man's nature has found true expression, it is worth preserving—it may only be cast aside if not expressed truly. There is a period in man's life when his feelings are the pathos of the inexpressible, the anguish of vagueness. The poetry which attempts its expression cannot be called baseless—at worst it may be worthless; but it is not necessarily even that. The sin is not in the thing expressed, but in the failure to express it.

There is a duality in man. Of the inner person, behind the outward current of thoughts, feelings and events, but little is known or recked; but for all that he cannot be got rid of as a factor in life's progress. When the outward life fails to harmonise with the inner, the dweller within is hurt, and his pain manifests itself in the outer consciousness in a manner to which it is difficult to give a name, or even to describe, and of which the cry is more akin to an inarticulate wail than words with more precise meaning.

The sadness and pain which sought expression in the *Evening Songs* had their roots in the depths of my being. As one's sleep-smothered consciousness wrestles with a nightmare in its efforts to awake, so the submerged inner self struggles to free

itself from its complexities and come out into the open. These *Songs* are the history of that struggle. As in all creation, so in poetry, there is the opposition of forces. If the divergence is too wide, or the unison too close, there is, it seems to me, no room for poetry. Where the pain of discord strives to attain and express its resolution into harmony, there does poetry break forth into music, as breath through a flute.

When the *Evening Songs* first saw the light they were not hailed with any flourish of trumpets, but none the less they did not lack admirers. I have elsewhere told the story of how at the wedding of Mr. Ramesh Chandra Dutt's eldest daughter, Bankim Babu was at the door, and the host was welcoming him with the customary garland of flowers. As I came up Bankim Babu eagerly took the garland and placing it round my neck said: "The wreath to him, Ramesh, have you not read his *Evening Songs*?" And when Mr. Dutt avowed he had not yet done so, the manner in which Bankim Babu expressed his opinion of some of them amply rewarded me.

The *Evening Songs* gained for me a friend whose approval, like the rays of the sun, stimulated and guided the shoots of my newly sprung efforts. This was Babu Priyanath Sen. Just before this the *Broken Heart* had led him to give up all hopes of me. I won him back with these *Evening Songs*. Those who are acquainted with him know him as an expert navigator of all the seven seas* of literature, whose highways and byeways, in almost all languages, Indian and foreign, he is constantly traversing. To converse with him is to gain glimpses of even the most out of the way scenery in this world of ideas. This proved of the greatest value to me.

He was able to give his literary opinions with the fullest confidence, for he had not to rely on his unaided taste to guide his likes and dislikes. This authoritative criticism of his also assisted me more than I can tell. I used to read to him everything I wrote at the time, and but for the timely showers of his discriminate appreciation it is hard to say whether these early ploughings of mine would have yielded as they have done.

* The world, as the Indian boy knows it from fairy tale and folklore, has seven seas and thirteen rivers. Tr.

(34) *Morning Songs.*

At the river-side I also did a bit of prose writing, not on any definite subject or plan, but in the spirit that boys catch butterflies. When spring comes within, many-coloured short-lived fancies are born and flit about in the mind, ordinarily unnoticed. In these days of my leisure, it was perhaps the mere whim to collect them which had come upon me. Or it may have been only another phase of my emancipated self which had thrown out its chest and decided to write just as it pleased; *what* I wrote not being the object, it being sufficient unto itself that it was *I* who wrote. These prose pieces were published later under the name of *Vividha Prabandha*, Various Topics, but they expired with the first edition and did not get a fresh lease of life in a second.

At this time, I think, I also began my first novel, *Bauthakuranir Hat*.

After we had stayed for a time by the river, my brother Jyotirindra took a house in Calcutta, on Sudder Street near the Museum. I remained with him. While I went on here with the novel and the *Evening Songs*, a momentous revolution of some kind came about within me.

One day, late in the afternoon, I was pacing the terrace of our Jorasanko house. The glow of the sunset combined with the wan twilight in a way which seemed to give the approaching evening a specially wonderful attractiveness for me. Even the walls of the adjoining house seemed to grow beautiful. Is this uplifting of the cover of triviality from the everyday world, I wondered, due to some magic in the evening light? Never!

I could see at once that it was the effect of the evening which had come within me; its shades had obliterated my *self*. While the self was rampant during the glare of day, everything I perceived was mingled with and hidden by it. Now, that the self was put into the background, I could see the world in its own true aspect. And that aspect has nothing of triviality in it, it is full of beauty and joy.

Since this experience I tried the effect of deliberately suppressing my *self* and viewing the world as a mere spectator, and was invariably rewarded with a sense of special pleasure. I remember I tried also to explain to a relative how to see the world in its true light, and the incidental lighten-

ing of one's own sense of burden which follows such vision; but, as I believe, with no success.

Then I gained a further insight which has lasted all my life.

The end of Sudder Street, and the trees on the Free School grounds opposite, were visible from our Sudder Street house. One morning I happened to be standing on the verandah looking that way. The sun was just rising through the leafy tops of those trees. As I continued to gaze, all of a sudden a covering seemed to fall away from my eyes, and I found the world bathed in a wonderful radiance, with waves of beauty and joy swelling on every side. This radiance pierced in a moment through the several strata of sadness and despondency which had accumulated over my heart, and flooded it with this universal light.

That very day the poem, *The Awakening of the Watertail*, gushed forth and coursed on like a veritable cascade. The poem came to an end, but the curtain did not fall upon the joy-aspect of the Universe. And it came to be so that no person or thing in the world seemed to me trivial or unpleasing. A thing that happened the next day or the day following seemed specially astonishing.

There was a curious sort of person, who came to me now and then, with a habit of asking all manner of silly questions. One day he had asked: "Have you, sir, seen God with your own eyes?" And on my having to admit that I had *not*, he averred that he *had*. "What was it you saw?" I asked. "He seethed and throbbed before my eyes!" was the reply.

It can well be imagined that one would not ordinarily relish being drawn into abstruse discussions with such a person. Moreover, I was at the time entirely absorbed in my own writing. Nevertheless as he was a harmless sort of fellow I did not like the idea of hurting his susceptibilities and so tolerated him as best I could.

This time, when he came one afternoon, I actually felt glad to see him, and welcomed him cordially. The mantle of his oddity and foolishness seemed to have slipped off, and the person I so joyfully hailed was the real man whom I felt to be in nowise inferior to myself, and moreover closely related. Finding no trace of annoyance within me at sight

of him, nor any sense of my time being wasted with him, I was filled with an immense gladness, and felt rid of some enveloping tissue of untruth which had been causing me so much needless and uncalled for discomfort and pain.

As I would stand against the verandah railing, the gait, the figure, the features of each one of the passers-by, whoever they might be, seemed to me all so extraordinarily wonderful, as they flowed past, waves on the sea of the universe. From infancy I had seen only with my eyes, I now began to see with the whole of my consciousness. I could not look upon the sight of two smiling youths, nonchalantly going their way, the arm of one on the other's shoulder, as a matter of small moment; for, through it I could see the fathomless depths of the eternal spring of Joy from which numberless sprays of laughter lap up throughout the world.

I had never before marked the play of limbs and lineaments which always accompanies even the least of man's actions; now I was spell-bound by their variety, which I came across on all sides, at every moment. Yet I saw them not as apart by themselves, but as parts of that amazingly beautiful greater dance which goes on at this very moment throughout the world of men, in each of their homes, in their multifarious wants and activities.

Friend laughs with friend, the mother dandles her child, one cow sidles up to another and licks its body, and the immeasurability behind these comes direct to my mind with a shock which almost savours of pain.

When of this period I wrote:

I know not how of a sudden my heart flung open
its doors,
And let the crowd of worlds rush in, greeting each
other,—

It was no poetic exaggeration. Rather I had not the power to express all I felt.

For some time together I remained in this self-forgotten state of bliss. Then my brother thought of going to the Darjeeling hills. So much the better, thought I. On the vast Himalayan tops I shall be able to see better and more deeply into what has been revealed to me in Sudder Street; at any rate I shall see how the Himalayas display themselves to my new gift of vision.

But the victory was with that little house in Sudder Street. When, after

ascending the mountains, I looked around, I was at once aware I had lost my new vision. My sin must have been in imagining that I could get still more of truth from the outside. However sky-piercing the king of mountains may be, he can have nothing in his gift for me; while He who is the Giver can vouchsafe a vision of the eternal universe in the dingiest of lanes, and in a moment of time.

I wandered about amongst the firs, I sat near the falls and bathed in their waters, I gazed at the grandeur of Kinchinjinga through a cloudless sky, but in what had seemed to me these likeliest of places, I found it not. I had come to know it but could see it no longer. While I was admiring the gem the lid had suddenly closed, leaving me staring at the enclosing casket. But, for all the attractiveness of its workmanship, there was no longer any danger of my mistaking it for merely an empty box.

My *Morning Songs* came to an end, their last echo dying out with *The Echo* which I wrote at Darjeeling. This apparently proved such an abstruse affair that two friends laid a wager as to its real meaning. My only consolation was that, as I was equally unable to explain the enigma to them when they came to me for a solution, neither of them had to lose any money over it. Alas! The days when I wrote excessively plain poems about *The Lotus* and *A Lake* had gone for ever.

But does one write poetry to explain any matter? What is felt within the heart tries to find outside shape as a poem. So when after listening to a poem any one says he has not understood, I feel nonplussed. If some one smells a flower and says he does not understand, the reply to him is: there is nothing to understand, it is only a scent. If he persists, saying: *that* I know, but what does it all *mean*? Then one has either to change the subject, or make it more abstruse by saying that the scent is the shape which the universal joy takes in the flower.

The difficulty is that words have meanings. That is why the poet has to turn and twist them in metre and verse, so that the meaning may be held somewhat in check, and the feeling allowed a chance to express itself.

This utterance of feeling is not the statement of a fundamental truth, or a scientific fact, or a useful moral precept.

Like a tear or a smile it is but a picture of what is taking place within. If Science or Philosophy may gain anything from it they are welcome, but that is not the reason of its being. If while crossing a ferry you can catch a fish you are a lucky man, but that does not make the ferry boat a fishing boat, nor should you abuse the ferryman if he does not make fishing his business.

The Echo was written so long ago that it has escaped attention and I am now no longer called upon to render an account of its meaning. Nevertheless, whatever its other merits or defects may be, I can assure my readers that it was not my intention to propound a riddle, or insidiously convey any erudite teaching. The fact of the matter was that a longing had been born within my heart, and, unable to find any other name, I had called the thing I desired an Echo.

When from the original fount at its core, streams of melody are sent forth over the universe, their echo is reflected into our heart off the faces of our beloved and the other beauteous things around us. It must be, as I suggested, this Echo which we love, and not the things themselves from which it happens to be reflected; for, that, which one day we scarce deign glance at, may be, on another, the very thing which claims our whole devotion.

I had so long viewed the world with external vision only, and so had been unable to see its universal aspect of joy. When of a sudden, from some innermost core of my being, a ray of light found its way out, it spread over and illuminated for me the whole universe, which then no longer appeared like heaps of things and happenings, but was disclosed to my sight as one whole. This experience seemed to tell me of the stream of melody issuing from the very depths of the universe and spreading over space and time, re-echoing thence as waves of joy which flow right back to the source.

When the artist sends his song forth from the depths of a full heart that is joy indeed. And the joy is redoubled when this same song is wafted back to him as hearer. If, when the creation of the Arch-Poet is thus returning back to him in a flood of joy, we allow it to flow over our consciousness, we at once, immediately, become aware, in an inexpressible manner, of the end to which this flood is streaming. And as we become

aware our love goes forth; and our selves are moved from their moorings and would fain float down the stream of joy to its infinite goal. This is the meaning of the longing which stirs within us at the sight of Beauty.

The stream which comes from the Infinite and flows toward the finite—that is the True, the Good; it is subject to laws, definite in form. Its echo which returns towards the Infinite is Beauty and Joy; which are difficult of being touched or grasped, and so do they make us beside ourselves. This is what I tried to say by way of a parable or a song in *The Echo*. That the result was not clear is not to be wondered at, for neither was the attempt then clear unto itself.

Let me set down here part of what I wrote in a letter, at a more advanced age, about the *Morning Songs*.

"There is none in the World, all are in my heart"—is a state of mind belonging to a particular age. When the heart is first awakened it puts forth its arms and would grasp the whole world, like the teething infant which thinks everything meant for its mouth. Gradually it comes to understand what it really wants and what it does not. Then do its nebulous emanations shrink upon themselves, begin to get heated, and heat in their turn.

To begin by wanting the whole world is to get nothing. When desire is concentrated, with the whole strength of one's being upon any one object whatsoever it might be, then does the gateway to the Infinite become visible. The morning songs were the first throwing forth of my inner self outwards, and consequently they lack any signs of such concentration.

This all-pervading joy of a first outflow, however, has the effect of leading us to an acquaintance with the particular. The lake in its fulness seeks an outlet as a river. Then, instead of trying to engulf, it proceeds to taste in bits. In this sense the permanent later love is narrower than first love. It is more definite in the direction of its activities, desires to realise the whole in each of its parts, and is thus impelled on towards the infinite. What it finally reaches is no longer the former indefinite extension of the heart's own inner joy, but a merging in the infinite reality which was outside itself, and thereby the attainment of the complete truth of its own longings.

In Mohita Babu's edition these *Morning Songs* have been placed in the group of poems entitled *Nishkraman*, The Emergence. For in these was to be found the first news of my coming out of the *Heart Wilderness* into the open world. Thereafter did this pilgrim heart make its acquaintance with that world, bit by bit, part by part, in many a mood and

manner. And at the end, after gliding past all the numerous landing steps of ever-changing impermanence, it will reach the infinite,—not the vagueness of indeterminate possibility, but the consummation of perfect fulness of Truth.

From my earliest years I enjoyed a simple and intimate communion with Nature. Each one of the coconut trees in our garden had for me a distinct personality. When, on coming home from the Normal School, I saw behind the skyline of our roof-terrace blue-grey water-laden clouds thickly banked up, the immense depth of gladness which filled me, all in a moment, I can recall clearly even now. On opening my eyes every morning, the blithely awakening world used to call me to join it like a playmate; the perfervid noonday sky, during the long silent watches of the siesta hours, would spirit me away from the work-a-day world into the recesses of its hermit cell; and the darkness of night would open the door to its phantom paths, and take me over all the seven seas and thirteen rivers, past all possibilities and impossibilities, right into its wonderland.

Then one day, when, with the dawn of youth, my hungry heart began to cry out for its sustenance, a barrier was set up between this play of inside and outside. And my whole being eddied round and round my stricken heart, creating a vortex within itself, in the whirls of which its consciousness was confined.

This loss of the harmony between inside and outside, due to the over-riding claims

of the heart in its trouble, and the consequent restriction of the privilege of communion which had been mine, was mourned by me in the *Evening Songs*. In the *Morning Songs* I celebrated the sudden opening of a gate in the barrier, by what shock I know not, through which I regained the lost one, not only as I knew it before, but more deeply, more fully, by force of the intervening separation.

Thus did the First Book of my life come to an end with these chapters of union, separation and reunion. Or, rather, it is not true to say it has come to an end. The same subject has still to be continued through more elaborate solutions of worse complexities, to a greater finale. Each one comes here to finish but one book of life, which, during the progress of its various parts, grows spiral-wise on an ever-increasing radius. So, while each segment may appear different from the others on a cursory glance, they all really lead back to the self-same starting centre.

The prose writings of the *Evening Song* period were published, as I have said, under the name of *Vividha Prabandha*. Those others which correspond to the time of my writing the *Morning Songs* came out under the title of *Alochana*, Discussions. The difference between the characteristics of these two would be a good index to the nature of the change that had in the meantime taken place within me.

Translated by

SURENDRANATH TAGORE

CHIPS FROM A HINDU WORKSHOP IN CHINA

By PROFESSOR BENAY KUMAR SARKAR, M.A.

I. Imperialism and *Laissez faire* in Ancient India.

SAKYASIMHA died in B.C. 483. The political history of India for the next century and a half may be supposed to repeat the story of the old struggle for overlordship, though documentary evidences are wanting. But by B.C. 322, the hegemony of Magadha state is established

and Chandragupta is found to be at its helm. He reigns from B.C. 322 to 298, and his grandson Asoka from 270 to 230.

The period is an epoch of nationalism, of a strong unified rule, and of a vast Imperialistic organisation. "For the first time in the history of India there is one authority from Afghanistan across the continent eastward to Bengal, and from the Himalayas down to the Central Pro-

vinces." The boundaries of this Indian Empire are further extended by Asoka so as to include the whole of Southern India excepting the extreme south which remains feudatory.

The Indian Napoleon commences his life-work by vanquishing the vanity of the barbarian Seleukos, the ruler of the Hellenistic Syria, who had invaded India.

The Year No. I of Chandragupta's Imperialism is his brilliant victory over this *mlechchha* (foreigner). It is with this fact that Indian political history, of which records have been preserved, really begins.

Referring to Greek invasion, however, Matthew Arnold started the superstition, now common to every westerner:

"The East bowed low before the blast
In patient, deep disdain;
She let the legions thunder past,
And plunged in thought again."

Even Mr. Vincent Smith, who is generally very sober, devotes a disproportionately large space to Alexander's campaign in his *Early History of India*. Strictly speaking, these researches should be incorporated with the investigations of Professors Mahaffy and Bury and have no place in a textbook of Indian history. The account of Alexander's expedition may loom large to students of Greece as a World-Power but is an incubus on the students of Indian civilisation. Besides, Mr. Smith himself admits that Alexander's enterprise did not leave any impression on India.

India did not "plunge in thought again." Says Rhys Davids:

"At the end of the fourth century B. C., Seleukos Nikator, then at the height of his power, attempted to rival Alexander by invading India. But he met with a very different foe Seleukos found the consolidated and organized empire of Magadha against which all his efforts were in vain. After an unsuccessful campaign he was glad to escape by ceding all his provinces west of the Indus, including Gedrosia and Arachosia (about equal to the Afghanistan of today), and by giving his daughter in marriage to the victorious Emperor of India in exchange for five hundred elephants of war."

Nirvanism of the Sakyasimhas did not militate against the establishment of the Indian Empire and the triumph over a foreign foe. About B.C. 300 India was not only a first-class power but the first power of the world, and Pataliputra, the capital, was the centre of gravity of the international system. The Hindus maintained this position unrivalled for a full century. It was only towards its close that Chinese Imperialism began to share with the In-

dian the same importance as a World-Power. Roman Imperialism was not yet conceived. Neither Sianfu, nor any of the Alexandrias, nor Rome, could thus vie with Pataliputra in its political prestige and diplomatic importance.

A natural concomitant of Imperialism both in China and India was the spirit of eclecticism and *laissez faire* in matters religious. A nation-maker cannot afford to be a dogmatist, a strict follower of the letter, for it is the "letter that killeth."

The great monarchs Chandragupta and Asoka were no hidebound pedants. Whatever their personal faiths, they knew that their function was not to advocate one or other of the prevailing *isms*, but to elaborate a new Imperialistic creed which should be quite independent of all. Their mission was not to be fulfilled by making the State subordinate to one or other of the speculative systems of the age. The *Zeitgeist* was therefore represented not by *Nirvanism*, or *Yogaism* or *Upanishadism*, or *Jainism*, but by the policy of let-alone and non-intervention so far as the people's views were concerned. The State cared solely for the systematic carrying out of a propaganda according to the financial, economic, political and militaristic teachings recorded in the *Arthashastra** of Kautilya.

II. Hindu Bushido and Indono Damashii.

We do not know exactly what was the personal faith of Chandragupta. The followers of Mahavira claim him for a Jaina. According to Hackmann in *Buddhism as a Religion*, "Chandragupta himself was not a Buddhist; he was on far more friendly terms with the Brahmins, and it was the same with his son Bindusara." And those modern scholars, who take their cue from a Schopenhauer, a Matthew Arnold and a Kipling in trying to understand India, need note that Megasthenes, the Head of the Hellenistic Embassy at Pataliputra, observed nothing of the so-called Nirvanism, quietism and pessimism. Says Hackmann:

"From the fragments of them ... we learn as to matters of importance very little about Buddhism. Megasthenes names the Buddhists as 'Sramanai,'

* This difficult Sanskrit work has been translated into English by Mr. R. Shamashastri for the Mysore Government and its materials utilised by Mr. Naren Law in his *Hindu Polity*.

and says that they were opposed to the 'Brahmanai.' But his description of their mode of life is vague, and he seems to mix the Buddhists up with other Indian sects."

This was perfectly natural, because Megasthenes came with his eyes open. He was not obsessed by any preconceived theory. He had not also the hypothesis of his own race as being superior. Rather he knew that he was living as a guest of the first power of the world. By the test of war Megasthenes the Greek belonged to an inferior race—he was the ambassador from a humiliated second-class power.

So in Pataliputra, the city of the East, this representative of the West noticed not the predominance of any non-secular and transcendental speculation but the apotheosis of Imperialism and all-round Eclecticism. The morality of the age can be expressed in the terms of *Sukraniti*, which, though a later compilation, does really represent the *Niti* or rules of life that have been prevalent since the age of Kautilya. The following is a translation from the Sanskrit texts edited by Gustav Oppert for the Government of Madras:

Even Brahmanas should fight if there have been aggressions on women and priests. (IV. vii. 599.)

The man who runs away from battle is surely killed by the gods (IV. vii. 601).

The life of even the Brahmana who fights when attacked is praised in this world, for the virtue of a kshatriya is derived also from Brahma. (IV. vii. 606-7).

The death of Kshatriyas in the bed is a sin. The man who gets death with an unhurt body by excreting phlegm and bile and crying aloud is not a Kshatriya. Men learned in ancient history do not praise such a state of things. Death in the home except in a fight is not laudable. Cowardice is a miserable sin. (IV. vii. 606-13).

The Kshatriya who retreats with a bleeding body after sustaining defeat in battles and is encircled by family-members deserves death. (IV. vii. 614-15.)

Kings who valorously fight and kill each other in battles are sure to attain heaven. He also gets eternal bliss who fights for his master at the head of the army and does not shrink through fear. (IV. vii. 616-19).

People should not regret the death of the brave man who is killed in battles. The man is purged and delivered of all sins and attains heaven. (IV. vii. 620-21).

The fancies of the other world vie with each other in reaching the warrior who is killed in battles in the hope that he be their husband. (IV. vii. 622-23).

The great position that is attained by the sages after long and tedious penances is immediately reached by warriors who meet death in warfare. (IV. vii. 624-25).

The rascal who flies from a fight to save his life is really dead though alive, and endures the sins of the whole people. (IV. vii. 636-7).

When the Kshatriyas have become clete, and

the people are being oppressed by lower orders of men, the Brahmanas should fight and extirpate them (IV. vii. 666-7).

This *Kshatriyaism* is *Bushido* according to Japanese notions, Chivalry in mediæval European phraseology, militarism in modern parlance. You may call this the spirit of Sparta.

Another aspect of Hindu Chivalry may be described from the authoritative *Laws of Manu*, the Moses of India. This work is generally recognised as older than Chandragupta and may be as old as Sakya (though, in its present form, probably as late as fourth century A.D.):

Let the soldier, good in battle, never guilefully conceal

(Wherewithal to smite the unwary) in his staff the treacherous steel;

Let him scorn to barb his javelin—let the valiant never arboit

With fell-poison juice his arrows, never put fire upon the point.

In his car or on his war horse, should he chance his foe to meet,

Let him smite not if he find him lighted down upon his feet.

Let him spare one standing suppliant, with his closed hands raised on high,

Spare him whom his long hair loosen'd blinds and hinders from to fly,—

Spare him if he sink exhausted; spare it he for life crave:

Spare him crying out for mercy, 'Take me for I am thy slave.'

Still remembering his duty, never let the soldier smite

One unarm'd, defenceless, mourning for one fallen in the fight;

Never strike the sadly wounded—never let the brave attack

One by sudden terror smitten, turning in base flight his back;

He, that flying from battle, by his foe is slaughter'd there,

All the burthen of his captain's sin hereafter shall he bear.

The translation is by Griffith. In these declarations by the Hindu International legists of Manu's School at least 2500 years ago we seem to be reading the latest resolutions of the 'Concert of Europe' at their Hague Conferences and the pious wishes of Peace-apostles like Carnegie.

As with Chandragupta, so with Asoka the contemporary of Shi Hwang-Ti. It is a far cry from the dogma of the historic Sakyasimha to the *Dhamma* proclaimed by Asoka. Besides, Asoka was a nationalist, i.e., an Imperialist first, and a follower of *Dhamma* afterwards.

Imperialists must necessarily be neutral in religious policy and eclectic in personal life unless they choose to fail like a Philip

II of Spain, a Louis XIV of France, an Aurangzib of India, or a James II of England. Asoka's Edicts are therefore neither the fiery fulminations of ban and anathema and a Bull of excommunication:—nor the autocratic proclamations of a so-called state-religion such as was embodied in the Inquisition, the Revocation of the Edict of Nantes, the Re-imposition of the Jizya, or the arbitrary Declaration of Indulgence. They are the sober and sedate expressions of a social-service-propaganda and a universal moral sense to which nobody in the world could object. Like his Chinese contemporary, Asoka was harsh towards pedants, e.g., the Brahmanas, and did not like their sacrifices, but had no objection to Brahmanas as such. Rather, he made toleration an important article of his faith.

Such religious neutrality, toleration and eclecticism have been exhibited by the Asoka of Modern Asia. Mutsuhito the Great of Japan is inspired by the same sanity of good sense and liberalism in his formulation of the Educational Rescript which characterises the "Meiji" Era or Epoch of "Enlightenment" in *Dai Nippon*. Like the "enlightened despot" of the third century B.C. the Mikado assumes the position of a schoolmaster. The picture is that of an Emperor, with a *ferula* in hand, administering to the whole empire as to an elementary school homœopathic doses of common-sense morality. The Proclamation is in the right patriarchal style,—comparable in its austere dignity and earnestness with the historic edicts of the Indian Emperor, and breathes the simple eloquence of the "Ten Commandments" though there is no mention of God in it:

"Know ye, Our subjects,

Our Imperial Ancestors have founded our Empire on a basis broad and everlasting and have deeply and firmly implanted virtue; our subjects ever united in loyalty and filial piety have from generation to generation illustrated the beauty thereof. This is the glory of the fundamental character of our Empire, and herein also lies the source of our Education. Ye, our subjects, be filial to your parents, affectionate to your brothers and sisters; as husbands and wives be harmonious, as friends true; bear yourselves in modesty and moderation; extend your benevolence to all; pursue learning and cultivate arts and thereby develop intellectual faculties and perfect moral powers; furthermore advance public good and promote common interests; always respect the constitution and observe the laws; should emergency arise, offer yourselves courageously to the state; and thus guard and maintain the prosperity of Our Imperial Throne coeval with heaven and earth. So shall ye not

only be our good and faithful subjects, but render illustrious the best traditions of your forefathers.

The Way here set forth is indeed the teaching bequeathed by our Imperial Ancestors, to be observed alike by their descendants and the subjects, infallible for all ages and true in all places. It is Our wish to lay it to heart in all reverence, in common with you, our subjects, that we may all thus attain to the same virtue."

This Imperial *Michi*, i.e., "Way" or *Tao* or *Magga* is neither Shintoism nor Confucianism, nor Buddhism, nor Christianity, and yet in a sense it is all. In fact, here is *Yamato Damashii*, the spirit of Japan. So also the *Dhamma* of Asoka embodies *Indono Damashii*, the spirit of Hindustan, rather than any *ism*. It is not necessary to connect or identify Asoka's creed or "way" with any of the *isms* of his day. Like one of his illustrious successors, Akbar the Great, he may be credited with having founded a new faith. Philosophically speaking, it was a practical morality evolved eclectically out of the thousand and one *isms* floating in the air. Historically, it may be traced to the positivistic element in others' teachings as well. Says Rhys Davids:

"The doctrine, as an ideal, must have been already widely accepted. But how sane the grasp of things most difficult to grasp! How simple, how true, how tolerant, his view of conduct and life! How free from all the superstitions that dominated so many minds, then as now, in East and West alike!"

In personal life Asoka may have been a daily reciter of the Pali Tripitaka and a monk of the Sakyan Order. But the statecraft enunciated in his *Dhamma* was not Sakyaism. The *Dhamma* was a distinctively new force meant to govern the life and thought of the day. To ignore this is to ignore the laws of social evolution and ignore the philosophy of history.

It is absurd to suppose that Shintoism or Buddhism explains modern Japan. It is absurd to believe that the primitive Christian doctrine, e.g., "The Kingdom of God is within you," had any significance in Mediæval Europe when Guelphs and Ghibellins were flying at each others' throats in every city and every state. It is childish to think that modern Germany can be understood solely on the strength of such terms as the Classicism of a Goethe, the Idealism and Romanticism of a Fichte and a Pestalozzi, or the *Zollverein* of a Frederick List, without reference to all that the name Bismarck connotes. It is equally absurd to try to explain China

and India of the third century B.C. and after by ignoring the Napoleonism of Shi Hwangti and the Machiavellism of Kautilya and the *Dhamma* of Asoka.

Chandragupta, Asoka, Shi Hwangti and Wu Ti are at least as powerful names in culture-history as Sakyasimha, Mahavira, Confucius and Laotse. They were, in fact, the great protagonists in the drama of contemporary life, having pushed every other character into the back-ground. The old super-annuated doctrines were given the go-by in the *denouement*; so that to the post-Mauryan Hindus and the later Hans the "new sun rose bringing the new year." There was no longer a Sakya the moralist, but a Buddha the god, one of those whom Sakya had most probably repudiated. No longer a Confucius the librarian-sage of Loo, but a Confucius the god, a colleague of Shangti.

III. Internationalism in Western Asia and India in Olden Days.

The ever-fighting city-states of Greece could not protect their freedom against the monarchical resources of Alexander's father, nor did they present a united front against him. So Alexander succeeded Philip to a rich conquest. With him the old spirit of Hellas had no charm. He had no Hellenic traditions. He began his life-work, therefore, by abolishing, first, the republican form of government, and secondly, the parochial nationalisms of the people. Then he started on a world-conquest which was as much intellectual as physical. To students of science his expedition looks like the campaign of modern anthropologists, archaeologists and naturalists. The pupil of Aristotle had mastered his comparative, historical and inductive methods quite well, though he rejected his system of city-states. So throughout his expedition he never forgot to bring about social and marital alliances between East and West, and to facilitate comparisons between facts of the same order by founding libraries, museums, gardens, etc. The whole route began to be dotted with Alexandrias, the nucleuses of race-mixture, culture-fusion, and wedlock between Asia and Europe, the ganglionic centres of an all-round eclecticism.

Alexander with his world-sense was altogether a new phenomenon in history. This conscious internationalism was a new force and left its stamp on Western Asia,

Egypt, and Greece, the principal field of its application, and to a certain extent on India and China. For centuries after the premature death of Alexander in B. C. 320 the spirit of Alexander dominated every part of Asia and Europe. Signs of the bridging of the gulf attempted and partially achieved by this greatest of idealists need be read (though with great caution) in every important item of the world's pre-Christian Culture.

It seems that Chandragupta had caught something of the great conqueror's internationalism, while a mere adventurer in the Punjab. Hence his acceptance of the daughter of Seleukos as wife. The marriage of a Hindu monarch with a Greek princess was an epoch-making event in Indian history like the expulsion of the foreigner. But such marriages were not few and far between in those days. It was probably an epoch of inter-racial marriages. Metropolitan life, e. g., at Pataliputra, was intensely international. Its position as the diplomatic centre of the world naturally made it the headquarters of foreign Embassies. Rhys Davids suggests the following picture :—

"And with the princess and her suite, and the ambassador and his, not to speak of the Greek artists and artisans employed at the court, there must have been quite a considerable Greek community, about B.C. 300, at the distant city on the southern bank of the Ganges."

Mr. Vincent Smith remarks in his *Early History of India* that "the Maurya Empire in the 3rd century B. C. was in constant intercourse with foreign states, and that large numbers of strangers visited the capital on business. Further, "all foreigners were closely watched by officials who provided suitable lodgings, escorts, and in case of need, medical attendance." According to this scholar, Hindu intercourse with Persians was greater than that with Greeks.

Internationalism inaugurated by Chandragupta continued under his successors. According to Lloyd in *The Creed of Half Japan*, while Bindusara (B. C. 297-272) "was on the throne, the king of Egypt sent an embassy, under a certain Dionysus, to Pataliputra; and on one occasion he wrote a letter to Antiochus, king of Syria, asking to have a professor of Greek sent to him. Greek writers speak of him.....that he adopted the Sanskrit title *Amitraghati*, the slayer of his foes."

Asoka also was a great internationalist. He cherished the ambition of being a world-monarch. In the 13th edict we read of his embassies to the kings of Syria, Egypt, Macedonia, Epirus, and Kyrene, to the Cholas and Pandyas in South India, to Ceylon and to the peoples dwelling on the borders of his empire. The missionaries sent out by him to various parts of the world were as much secular as religious—at once the St. Augustines, Aleuins and Sir Thomas Roes of Hindusthan. Himself combining the functions of a Caesar and a Pope, Asoka's 'legates,' those 'hands and eyes,' were necessarily the plenipotentiaries and consul-generals for his empire.

Mr. Lloyd gives a detailed account of Asoka's missionary activity.

"These sovereigns and peoples Asoka addresses mainly on two subjects—care for the health and welfare of the people, and 'true conquest' over themselves and their passions." He refers to the "Greek merchants trading and travelling in India, whose votive inscriptions have been found in ancient Buddhist temples in the peninsula."

We read:

"It was to Antiochus I. (of Syria) that Asoka had applied for assistance as to medicinal herbs.* * * In the wars which Antiochus I. waged against the Gauls and Celts.....he had used elephants which he, like his contemporary, Pyrrhus of Epirus, had obtained from Asoka's father, Bindusara....."

Macedonia must have been full of men who had been in Central Asia and India in those days of constant coming and going, and there must have been a great interest taken in things Indian.....

Among the dialogues of Aristippus the founder of the Cyrenaic School of Philosophy, there was one which bore the name of Porus, a name well known among Indian kings.....

Alexandria was connected with India by at least three routes. A certain amount of the overland traffic from China came into Alexandria via Palestine (which was in the Egyptian sphere of influence), and even the superior attractions of Antioch could not kill this commerce, which was, however, more Central and Eastern Asian than Indian. A further contingent of caravans brought in Indian goods via the Persian Gulf, Palmyra (later) and Palestine. The Egyptian ports in the Red Sea had direct communication, without any serious rivals, with the Indian ports at the mouth of the Indus."

Internationalism must have continued during the post-Asokan times also. For Sewall remarks in *The Imperial Gazetteer of India*, Vol. II. on the commerce of the period from B.C. 200 to A.D. 250: "There was trade both overland and by sea with Western Asia, Greece, Rome and Egypt, as well as with China and the East. * * * Pliny mentions vast quantities of specie

that found its way every year from Rome to India." And for the same period in Northwestern India there was great intercourse with Rome during the ascendancy of the Kushans.

(b) CENTRAL ASIA AND CHINA.

The early history of the intercourse of China with foreigners is not yet clear. Scholars like Lacouperie have been assiduous in proving the connexion of the Celestials with the Hindus, Persians and Babylonians from pre-Sakyan and pre-Confucian times. Astrological notions, totemistic practices and some of the superstitions, as well as 'the whole Taoistic metaphysics and 'hocuspocus' have been traced to foreign sources. Even the theory has been started that the first Emperor Shi Hwang Ti, the contemporary of Asoka, "was in some way connected" with the Maurya Dynasty of India. And there is a tradition that Buddhism first came to China about B.C. 217. ●

Incontestable evidences are not forthcoming. Hence Hirth, the great authority on the ancient period of Chinese history, is sceptical about any foreign religions of China before Wu Ti's time. And yet he is compelled to criticise himself thus:

"We possess the most plausible arguments for the introduction of foreign influences in Chinese culture at the time when relations with Western Asia were opened under the Emperor Wu Ti at the end of the second century B.C.; but if we examine numerous facts still on record as referring to times immediately preceding the Wu Ti period we are bound to notice that changes of a different kind had come over the Chinese of this as compared with those of the Confucian and pre-Confucian periods. The growing influence of foreign elements from Tsin in the west, Chau in the north, and Chu in the south may account for this. Lau-tzi, as a native of the state of Chu, was born and probably brought up among the southern barbarians."

Further:

"Altogether, readers of the history of Chau, as represented in Ssima-Tsien's account, will receive the impression that it contains various prognostics of that important change in cultural life which became dominant in the age of Tsin Shi Hwang Ti; namely a Tartarised China, the traditional Confucian views of life having been supplanted by Tartar, Scythian, Hunnic or Turkish elements, elements that, whatever name we may give them, had grown out of the national life of Central Asiatic foreigners."

Just as Western Asia plays an important part in Indian history of the 3rd century B.C., so Central Asia, i.e., the regions to the west of China, plays an important part in her history of the period. And Central Asia is also the connecting link

between India and China. Wu Ti formed an alliance with the Yuch Chi or Indo-Scythians against the common enemy, the Huns. Later, to quote Gowen, "the great generals carried the arms of China into Western Asia, caused the banners of Eastern Empire to meet the banners of Rome on the shores of the Caspian, and made a way for the merchants of China to carry their silk and iron into the markets of Europe."

The following is from Parker's *China*:

"A great revolution in thought took place about two centuries before our era; the time coincides with the conquests of the Parthians, and it is possible that Graeco-Roman civilisation was affected by the same wave that influenced China—whatever it was. At all events, there was a general movement and a simultaneous expansion in the world all the way from Rome to Corea. The result was that China now first heard of India, Buddhism, and the Parthians."

Eitel's *Buddhism* also may be quoted:

"Chinese armies had been fighting a series of campaigns in Central Asia and had repeatedly come into contact with Buddhism established there. Repeatedly it happened that Chinese generals, engaged in that war, had occasion to refer, in their reports to the throne, to the influence of Buddhism."

Laurence Binyon in his *Painting in the Far East* speaks of the same foreign intercourse in the following terms:

"In B.C. 200 the Chinese seeking markets for their silk opened communication with Western Asia. A century later the Emperor Wu Ti sent a mission to the same regions. Greek designs appear on the earliest metal mirrors of China. It is possible that in the Chinese fable of the Paradise of the West the myths of the Greeks may be reflected."

The whole epoch beginning with Alexander's accession to the Greek throne and extending for at least three centuries may be presumed to have been one in which race-boundaries were being obliterated, cultural angularities were being rounded off, people's intellectual horizon was being enlarged, and the sense of universal humanity generated. It was a time when the Aristotelians, Platonists, "Cynics" and Stoics were likely to meet the Apocalyptists, Zoroastrians, Confucianists, Taoists, *Nirvanists* and Yogaists on a common platform,—when the grammarians and logicians of Alexandria were probably comparing notes with the *Paninians* and *Darsanists* of India, when the herbalists of Asia Minor could hold debates with the Charakan Ayurvedists of Hindusthan, when, in one word, culture was being developed not

from national angles but from one international view-point and placed as far as possible on a universal basis. The courses of instruction offered at the great Universities of the world, e.g., those at Honanfu, Taxila, and Pataliputra, the Alexandrias, and Athens, comprehended the whole encyclopædia of arts and sciences known to both Asia and Europe.

The *literati*, *bhikshus*, magi and *sanyasins* of the East met the mystics, sophists, gnostics and peripatetics of the West at out-of-the-way inns or caravanserais or at the recognised academies and seats of learning. 'Universal-Races-Congresses' and International Conferences of Scientists may have been matters of course, and every man who was of any importance—Hindu, Chinese, Persian, Egyptian, Greek—was necessarily a student of world-culture and a citizen of the world. This intellectual expansion influenced the social systems also in every part of the civilised world. Inter-racial marriages may be believed to have been things of common occurrence, and everywhere there was a *rapprochement* in ideals of life and thought. The world was fast approaching a common consciousness, a common conscience and a common standard of civilisation.

A picture of this fusion of cultures though for a subsequent period is given by Laurence Binyon in his chapter on *Early Art Traditions in Asia*.

"What then do we find in this little, remote kingdom in the heart of Asia? We find sculpture and paintings, we find heaps of letters on tablets of wood; odds and ends of woven stuffs and furniture; and police notices on strips of bamboo. The police notices are in Chinese. The letters are written in a form of Sanskrit. But the string with which the wooden tablets are tied is sealed with a clay seal; and in most cases the seal is a Greek seal, the image of an Athena or a Heracles. Here, then, we touch three great civilisations at once: India, Greece, China....."

If we ask ourselves what affinities these paintings reveal, with what art we can connect them.....we are reminded of features in Indian, Persian, Chinese and Japanese Painting.....

Will the sculptures tell us more? They at once remind us of other sculpture.....We see what seems a Greek Apollo; and then little by little the Greek features become more Indian; Apollo transforms himself into a Buddha."

The marriage of Asia with Europe—that meeting of "the twain" which is never to be—was thus an accomplished fact in every department of human culture at least 2200 years ago!

IV. The Pioneers of Asiatic Unity.

The fortunes of Buddhism during the period of so-called anarchy in China may be thus described in the word of Hackmann:

"The most striking fact, to which too little notice has so far been given, is that it was not till the beginning of the fourth century A.D. that the Chinese were allowed to become monks in the Buddhist religion. The authorised representatives, therefore, of the new religion were foreigners during the first two and a half centuries. A roll of names of foreigners has been handed down to us who came from India, from the Himalayan states, and from Central Asia, to take charge of Buddhism in China. For a long time their most important labours consisted in translations of the books of the Buddhist Canon.....Till about A.D. 300 the translators were all foreigners (with the exception of one Chinese layman)."

The following is taken from Giles:

"It was not until A.D. 335 that the Chinese people were allowed to take Buddhist orders. This permission was due to the influence of a remarkable Indian priest, named Budhachinga, who reached the capital in A.D. 310.....Buddhism now began to take a firm hold; and under the year 381 we read of a special temple built for priests within the Imperial palace. A further great impetus to the spread of this religion was given by the arrival, about the year 385, of Kumarajiva.....He laboured for many years as a translator, dying in 417.....The work by which he is best known.....is the translation of what is called *The Diamond Sutra*.....which teaches that all objects, all phenomena are illusory, and have no real existence,.....seems to show that faith in Buddha through the Buddhist scriptures can also make a man 'wise unto salvation'.....While Kumarajiva was spreading the faith in China, and dictating commentaries on the sacred books of Buddhism to some eight hundred priests, the famous traveller, Fa Hien, was engaged upon his adventurous journey."

The heroic idealism as well as lofty spirituality which inspired Fa Hien in his arduous journey (A.D. 399-413) were characteristics of the Chinese converts of the day. The following is taken from Legge's translation of Fa-Hien's *Travels*:

"That I encountered danger and trod the most perilous places, without thinking of, or sparing myself, was because I had a definite aim, and thought of nothing but to do my best in my simplicity and straightforwardness. Thus it was that I exposed my life where death seemed inevitable, if I might accomplish but a ten thousandth part of what I hoped."

Fa Hien's noble personality can be understood also from the following account of Giles:

"He brought with him a large number of books and sacred relics, all of which he nearly lost in the Bay of Bengal. There was a violent gale, and the ship sprang a leak. As he tells us in his own account of the journey, 'he took his pitcher and ewer, with whatever else he could spare, and threw them into

the sea; but he was afraid that the merchants on board would throw over his books and images, and accordingly he fixed his whole thoughts upon Kuan-shih-yin or Kuan Yin, the Hearer of the Prayers of the World, and prayed to the sainted priests of his own country, saying, 'Oh that by your awful prayer you would turn back the flow of the leak and grant us to reach some resting place!'"

These are the words of a real *bhakta* or lover, be he a Shaiva, a Vaishnava, a Ramaite, a Jaina, or a Buddhist. The Religion of Love and Faith was established in China by genuine Romanticists and self-abnegating devotees of the Fa Hien-type.

With Kumarajiva and Fa Hien, *i.e.*, towards the beginning of the 5th century, we enter a new era of Indo-Chinese relationships. It marks the beginning of an intimate cultural and spiritual union between the two peoples, which, backed by equally deep commercial and political intercourse, has given rise to that composite crystal of human thought known as Asiatic Culture. The land of Sakyasimha and the land of Confucius met at last in a real "Holy Alliance." For the next thousand years (*i.e.* down to about A.D. 1453, the year of the capture of Constantinople by the Turks), the life and activity of human beings from Kyoto to Cairo were governed by one Asiatic science, art and philosophy. This, carried to Europe by Arab intermediaries, became also the foster-mother of that Renaissance, the ultimate results of which we have been witnessing in the world since 1815. That chapter of world's mediæval history has yet to be written.

Hindu culture in general, and Buddhism in particular, may now be said to have come to stay in China. Indianism was no longer a mere "interest" of curious hunters and faddists; but on the fair way to be a permanent factor in Chinese civilisation. According to Hackmann, "perhaps the renown attained by the Chinese Buddhism of that period is best demonstrated by the striking event that in the year A.D. 526 the patriarch of Indian Buddhism, Bodhidharma, the twenty-eighth in the list of the Buddha's successors, left his native land and migrated to China, which thence-forward became the seat of the patriarchate."

V. "World-sense" and Colonising Enterprises of the Hindus.

The Hindus of the fourth, fifth and sixth

centuries were not living in "splendid isolation," as it has been the fashion to suppose that the Asiatics have ever done. As in previous ages, so under the Guptas they kept up cultivating the "world-sense."

In the first place, it must be remembered that India alone is a world by herself—the whole of Europe minus Russia. Therefore, for the Hindus to be able to develop the "India-sense" in pre-steam days must be regarded as an expression of internationalism of high order. Considered territorially, and also in terms of population, the world-sense of the Roman Emperors was not greater than that of the Hindu Imperialists.

The Internationalism of the Hindus was extra-Indian too. It is well-known that the world of Kalidasa's poetry includes the whole of India and also the Indian borderland and Persia. The fact that with the fifth century is augmented the stream of traffic between India and China both by land and sea is itself an indication of the "Asia-sense" they had been developing. It may be said that the Mauryas had cultivated mainly the relations with West-Asia, the Kushans had opened up the Central-Asian regions, and the Guptas developed the Far Eastern intercourse. The Hindus could now think not only in terms of India but of entire Asia.

The larger world beyond Asia was also to a certain extent within the purview of the Hindus. Ever since Alexander's opening up of the West-Asian route, the Hindus had kept touch with the "barbarians." About the first century A.D. Hindu trade with the Roman Empire was not a negligible item of international commerce. The *Periplus of the Erythrean Sea* (c. A.D. 100) is a document of that Indo-Roman Intercourse. Both the Kushans in the North and the Andhra Monarchs in the South were interested in Rome.

In the *Imperial Gazetteer of India* (India, Vol. II.) Sewall describes the foreign trade of the Hindus under the South Indian Andhras (B.C. 200—A.D. 250):

"The Andhra period seems to have been one of considerable prosperity. There was trade both overland and by sea, with Western Asia, Greece, Rome, and Egypt, as well as with China and the East. Embassies are said to have been sent from South India to Rome. Indian elephants were used for Syrian warfare. Pliny mentions the vast quantities of specie that found its way every year from Rome to India and in this he is confirmed by the author of the *Periplus*. Roman coins have been found in profusion in the peninsula, and especially

in the south. In A.D. 68 a number of Jews, fleeing from Roman persecution, seem to have taken refuge among the friendly coast people of South India and to have settled in Malabar."

The following picture of foreign settlements in Southern India is given by Vincent Smith:

"There is good reason to believe that considerable colonies of Roman subjects engaged in trade were settled in southern India during the first two centuries of our era, that European soldiers, described as powerful Yavanas, dumb Mlechhas (barbarians), clad in complete armour, acted as body-guards to Tamil kings."

According to the same authority Chandragupta II. Vikramaditya (A.D. 375-413) of the Gupta dynasty was "in direct touch with the sea-borne commerce with Europe through Egypt."

Besides, intercourse with Further India and the colonisation of Java form parts of an adventure which in Gupta times was nearing completion. In fact, with the fourth century A.D. really commences the foundation of a "Greater India" of commerce and culture, extending ultimately from Japan in the East to Madagascar in the West. The romantic story of this Expansion of India has found its proper place in Mookerji's *History of Indian Shipping and Maritime Activity from the Earliest Times*. The heroic pioneers of that undertaking were all embodiments of the world-sense.

It would thus appear that the travels of Kumarajiva the Hindu Missionary (A.D. 405) and of Fa Hien the Celestial Apostle were facts of a nature to which the Indians had long been used. The Chinese monks came to a land through which the current of world-life regularly flowed. Hindusthan had never been shunted off from the main track of universal culture. To come to India in the age of the Guptas was to imbibe the internationalism of the atmosphere.

Regarding the Indo-Chinese intercourse of this age the following extracts from *The Epochs of Chinese and Japanese Art* are interesting:

"Of what took place in the Tartar regions of the north we know little, since their dynasties have not been recognised by Chinese historians as legitimate. The true Celestial annals, indeed the lore of Chinese genius, belong at this time to the stimulus afforded by the new southern conditions. The new capital, near the present Nanking, was on the great Yangtse.....The Southern seats of the Chinese were in closer proximity to a new part of India, the south through Burma, or along the opening lines of coast trade.....It was here, too, in the Southern

Chinese nests, that Buddhism could drop her most fertile germs."

It may be mentioned that the patriarch Bodhidharma, originally a South Indian Prince, reached Canton by sea and was then invited to Nanking (A.D. 520).

The above is a picture of the sea-traffic. References to this are to be found in the *Kwai-Yuen Catalogue* (A.D. 730) of the Chinese *Tripitaka* which has been drawn upon by Prof. Anesaki for his paper in the J.R.A.S. (April, 1903).

It must not be forgotten, besides, that Kucha and Khotan, the halfway house between India and China, remained all this while the great emporium of Hindu culture and Graeco-Buddhist art. Manuscripts, unearthed by Stein and others, both in Kharoshthi and Chinese scripts, prove that Central Asian Indianism flourished during the period from 3rd century A.D. to 8th or 9th. And it was the Central Asian land-route which was traversed by Fa Hien in A.D. 399 and later by Hsuen Tshang in A.D. 629 on their way to India, from which both returned home by sea.

VI. Comparative Chronology and Comparative History.

A parallel study of the dates and facts of political history of the Chinese and Hindu as well as the European races from earliest times down to 1815 (and even 1870) would bring out the facts:

1. That there have been at least as many instances of strong and centralised rule in the Orient as in the Occident; and necessarily as many periods of anarchy also.

2. That the durations of unified administrations have been equally long or short both in China and India as well as in Europe.

3. That Chinese and Hindu history as well as the history of other Asiatic peoples can present no fewer Alexanders and Napoleons than the history of European races.

4. That Asiatic aggressions upon Europe have been at least as frequent as the inroads of European races into the East.

5. That the defeat and expulsion of foreign invaders by Asiatic peoples are as solid facts of oriental history as the retreat of Persian, Saracen, Tartar and Turkish nationalities from the heart of Europe.

6. That the cases of successful resistance of enemies' military inroads in Asiatic or European history cannot be convenient-

ly explained away as instances of home-keeping conservatism, or desire for "splendid isolation," or absence of international spirit on the part of any people.

7. That the ability to bring within the pale of one culture three hundred or four hundred millions of people indicates as great "aggressiveness" on the part of the Hindus or the Chinese as the ability to spread a common civilisation among the heterogeneous races of Europe on the part of the Westerners.

8. That if twenty, thirty, or forty millions be the human basis of a 'nationality,' as has been the case in the West during the last forty years, Asiatic peoples have always given rise to such nation-states.

9. That fratricidal and internecine wars between peoples of the same race and religion have been at least as frequent in the West as in the East.

10. That instances of one Asiatic people dominating another have not been greater than those of the exploitation or "government of one people by another" in Europe.

11. That in ancient and mediæval times the nations of Asia have had knowledge about one another as much as or as little as the nations of Europe about themselves.

12. That the ignorance of Europeans regarding the Asiatics in ancient and mediæval times has been, to say the least, as profound as that of the Asiatics regarding the Europeans.

13. That 'splendid isolation' was equally true of both Asiatics and Europeans.

14. Hatred of foreigners was as powerful in the West as in the East; such terms as "barbarians" "heathens," "infidels," "vile Turk" "nigger," etc., are found in non-oriental languages.

15. Besides, the morals and manners of the Court of Peking have been out-Pekinged in lands other than Cathay. Thus Macaulay speaks of court-life in England under the Stuarts with his characteristic eloquence in his *Essay on Milton*:

"Then came those days never to be recalled without a blush, the days of servitude without loyalty and sensuality without love, of dwarfish talents and gigantic vices, the paradise of cold hearts and narrow minds, the golden age of the coward, the bigot and the slave. The King cringed to his rival that he might trample on his people, sank into a viceroy of France, and pocketed, with complacent infamy, her degrading insult, and her more degrading gold. The caresses of harlots and the jests of buffoons regulated

the policy of the state. The Government had just ability enough to deceive, and just religion enough to persecute. The principles of liberty were the scoff of every grinning courtier, and the anathema maranatha of every fawning dean. In every high place, worship was paid to Charles and James, Belial and Moloch, and England propitiated those

obscene and cruel idols with the blood of her best and bravest children. Crime succeeded to crime, and disgrace to disgrace, till the race accursed of God and man was a second time driven forth, to wander on the face of the earth, and to be a by-word and a shaking of the head to the nations."

PORTUGUESE COLONIES IN INDIA—THEIR FATE

THE fourth centenary of the death of Affonso of Albuquerque was recently celebrated in the Portuguese Colonies in India. It was made the occasion for a demonstration of good feelings between the Portuguese in the Continent and the Colonies—feelings which, of course, arise from the sense of common citizenship.

The figure of Albuquerque still stands clear in the light of history over the wreck of the past. He is a man whom the Portuguese regard as the founder of a well-nigh forgotten empire, the establisher of their national faith in the East. The centenary made, therefore, its appeal on the one side to the patriotism of Portuguese and on the other side to the religious beliefs and aspirations and hopes of the majority of Portuguese.

It is interesting to note that a Provincial Congress met in Goa last April. It was attended by the representatives of the municipalities, village communities and other local bodies. The Congress was summoned by Dr. Couceiro da Costa the Governor-General of Portuguese India, whose administration has inspired a wide measure of general confidence. Imbued with a hearty sympathy for the grievances and aspirations of the people he governs, he appointed a Provincial Congress Committee selected impartially from men of all political opinions to promote this Congress; and it is significant, the fact that the Congress was to meet for the first time on the fourth centenary of the death of Albuquerque, whose memory ranks in the minds of the people of Portuguese India among the greatest of Portuguese who have fought to secure for them justice and privileges that they should enjoy as Portuguese.

Humiliating as is the confession, it

must be owned that Portugal with all which that word suggests, is haunted from time to time by heroic visions. Whenever the evils of her condition cry aloud for redress, there kindles in the mind of the nation the desire of emulating the renown of her great ancestors. Interested in past things, because they happened but not because they are still powerfully affecting the nation, Portugal remembers her ancient exploits of valour, and makes most of her annals—annals which attract the scholar and challenge the attention of the political inquirer, but nevertheless annals that portray at once the cradle and the grave of Portuguese greatness. This contemplation of the past, without penetrating the recesses of bygone ages with intelligent skill, has given birth to serious evils. It has, indeed, stood in the way of the development of a true and healthy national life. And if history be rightly defined as philosophy teaching by examples, there are not many instances such as Portugal affords of wilful disregard of its repeated lessons.

The East Indies enabled Portugal to keep up a certain grandeur. The expeditions of Vasco de Gama, the conquests of Albuquerque and the bravery of Duarte Pacheco raised Portugal to a pitch of wealth and power that excited the admiration of the whole world. But all at once, this ephemeral greatness vanished. The Portuguese dominion in the East rested upon two ruinous bases, a navy which could easily be equalled, and men who became insensible to the calls of honour.

Dom Francisco d'Almeida, the first Viceroy of India, sought to subordinate all else to sea-power. "Almeida" says Osorio, the chronicler of King Manuel I,

"judged that there would be little security if the Portuguese assailed the cities of India from the danger of dividing their forces and weakening them. Therefore, his counsel was to hold the sea, for he considered that the master of the sea was master of the whole India." The policy of Almeida was supported at the Court of Lisbon by Duarte de Lemos and Goncalo de Sequeira. The Portuguese captains in India advocated it "in language," says Morse Stephens, "which vividly recalls that used by the English East India Company two centuries and a half later." These views, however, were not held by Albuquerque who had been entrusted by his sovereign with the scheme of founding an Empire in the East. "Animated by the higher hopes which great minds are usually accustomed to conceive," says the chronicler Osorio, "he thought of the means not only of assuring the affairs of the Portuguese for a few years, but also of gaining a firm footing for their domination, which he assured himself would be very widely extended in the future."

Albuquerque, within the short period of five years (1507-11), succeeded in establishing the Portuguese supremacy in the East. He took Goa, a flourishing place for commerce, by reason of the excellence of its harbour, which he chose for the capital of the Eastern Empire; he made himself master of Ormaz, which commanded the narrows through which the trade with Persia and through Persia with Europe had to pass; he captured Malacca, the key of the navigation of the Indian archipelago, which commanded the narrows between Sumatra and Malay Peninsula and thus let Portugal appropriate all the trade which the Arabs had carried for nearly six centuries. Brought up at the Court of King Affonso V, in whose palestra, "he strove emulously," to quote Barbosa Machado, "to become the rival of that African Mars," Albuquerque even hoped to induce the famous Prester John to divert the Nile into the Red Sea and so to starve Egypt. He also sketched the course of a campaign designed to redeem Palestine.

The Portuguese set out to break up the barriers which the followers of the Crescent had raised up between the people of Europe and the races inhabiting Asia. They were, therefore, so much accustomed to think of Portugal as supreme—a

supremacy which was but of Yesterday—that they sometimes forgot that they were confronted with a civilisation older than that of Europe. Vasco de Gama's gifts, for instance, to the Zamorin of Calicut comprised such articles as washing basins, casks of oil and strings of coral—goods which might be sent to an African chief but seemed hardly proper to a powerful Hindu ruler! Albuquerque's imperial policy, however, attested his profound respect for political morality and his knowledge of political obligations. He, no doubt, tortured prisoners surrendered at Goa, cut off the ears and noses of defenceless fishermen in the Red Sea and planned the murder of Rais Ahmad. But, nevertheless, he took into account the different social conditions and political necessities of India. The union of judicial and revenue functions which is today adopted by the British in India, had been adopted by Albuquerque in his scheme of settlement of Goa. The co-operation of the Indians with European officials was a part of his policy. Albuquerque likewise understood the value of Indian troops. In his expedition to the Red Sea, he employed 800 soldiers. He did away with the custom of the *Suttee*—the burning of the widow—a custom not abolished in British India until 1829. But above all Albuquerque maintained intact the constitution of the village communities into which Goa was divided; and shortly after his death a code called *Foral de Usos e Costumes* was compiled to serve as a guide to his successors.

But the conquests of the Portuguese ceased with Albuquerque. By 1505 the Empire he founded became dependent on subsidies from the Royal Treasury in Lisbon! Meantime the war between the Turks and Egyptians, which allowed the Portuguese to develop in the East had ended in 1517 with the overthrow of the Mameluke dynasty.

"Evils increased and good things diminished," wrote the chronicler Gaspar Correia in his *Lendas da India*, which embraces the events of the years 1494-1550, "so that almost the whole became a living evil and the historian of it would rather be called the imprecator than the writer of illustrious deeds." The administration of the Eastern Empire became a hotbed of knavery and corruption. Money was extorted for safe conducts at sea and trading licences and this formed, indeed, a very im-

portant portion of the revenue; the Portuguese exacted a considerable contribution from the native states; and the Crown lands in India yielded an enormous income. All this wealth, however, was no longer regarded as national revenue. "The royal revenue," says Faria e Sousa, the historian of the Portuguese deeds in the East, "should have been double but it was reduced by frauds"—frauds which cannot be remembered now without shame and sorrow. Bent on enriching themselves as speedily as possible the Portuguese officials resembled a flock of vultures battling over a corpse. "All the officers", says Faria e Sousa, "have great salaries besides their lawful profits and their more considerable frauds, though their salaries are enough to make them honest; but avarice knows no bounds." It was, indeed, disgraceful, the state into which Portuguese rule fell, when it began to be weak as well as wicked. "Robbery is so public and common", were the words of Francis Xavier the Apostle of the Indies, writing to a brother Jesuit on June 22, 1545 "that it hurts no one's character and is hardly counted a fault: people scarcely hesitate to think that what is done with impunity cannot be bad to do." These were the principles on which the Portuguese governed the East Indies.

But worse still, this unbridled tyranny went hand in hand with religious bigotry and crass ignorance. The affection the Portuguese formerly entertained for their municipal institutions and Cortes was transferred to the tribunal of the Inquisition, which destroyed the former manliness of Portuguese and fitted them for despotism. "I do not know," wrote the Viceroy Joao de Saldanha de Gama, "under what law the Inquisition pretends to have the right to try men who were never Catholics, but what I see is that on account of excessive number of prisoners of this description all the northern province is depopulated, the admirable factory of Thana is lost, and a corresponding one is commenced at Bombay from whence the English take silks, woolen goods and other merchandise which they introduce into Portugal." The Portuguese sank and stranded the ships of the so-called heathen, burned their temples, trampled on their books and threw them into flames. This truculent ruffianism pretended to be animated by the crusading spirit. But the Portuguese had sunk in more debasing idolatry. Martim Affonso

de Sousa, Governor of India from 1542 to 1545, when informed that the Conjeeveram Temples of Vijayanagar contained a fabulous treasure thought it was *not unchristian* to spoil the heathen of their ill-gotten gains.

Portugal owed her greatness to religious ideals. Her whole history shows no works of genius except such as were influenced by sacred enthusiasm. It was religion that formed the earliest basis of national union; it gave first the idea of an united Portugal. It was not merely cherished as a form of faith, but as a principle of honour. It was a part of national history. It is impossible not to note the religious faith which shines in the granite pillars in lands discovered by the Portuguese navigators, where are sculptured the Royal Arms of Portugal and a cross set up in sign that the territory belonged to a Christian King. In visiting Portugal to-day and asking to be directed to the greatest and the only works of Art the traveller is confronted with the monuments of this faith, monuments associated with a long and varied national life. When I approached these monuments I saw built and carven in stone the heroic age of Portugal. Time has scarcely touched the solid masonry. Alcobaca, which commemorates the origin of Portugal, was founded with the spoils gained by the first King of Portugal in his wars with the Moors. The Abbey of Batalha was built to commemorate the victory of the people and its chosen King; and here were preserved the helmet and sword worn by the Portuguese King at Aljubarrota. The Church of Jeronimos, that historical monument that calls up the soul of Portugal to those who now behold its corpse, was built in memory of the discovery of a new way to India.

But once the inspiring poetry of religion was destroyed the nation immersed itself in material facts. "The Portuguese," were the words of the great Viceroy Dom Jono de Castro, "entered India with the sword in one hand and the Crucifix in the other; finding much gold, they laid aside the Crucifix to fill their pockets." Dom Jono de Castro died in the arms of his friend the Jesuit Francis Xavier. The cause of his death according to Faria e Sousa "was a disease which today kills no man.....for diseases also die. It was a keen sense of the wretched state to which

India had come and of his own inability to repair it."

The Portuguese supported with the edge of their swords their trembling Empire. Dom Francisco da Gama, the Viceroy of India, received orders to levy 2 per cent. consular duties at certain ports "with a view of raising a fund for the equipment of a fleet" to turn out of India the Dutch—a danger which was foreseen from the first by Dom Francisco d'Almeida, the first Viceroy of India. His presentiment was now an accomplished fact! Ormuz was lost to the combined Persian forces in 1622. Muscat was wrested from the Portuguese by the Arabs in 1650. Malacca was lost in 1641. Colombo fell in 1656. Ceylon was taken away in 1658. In 1673 the settlement of Hugli in Bengal was attacked by the forces of the Mogul Shah Jehan, which was a blow to the Portuguese prestige in the East.

The dream of Greater Portugal was over but the effects remained. The geographical discoveries and conquests in the East deprived Portugal of the best part of her population and also expended her resources almost to the verge of exhaustion. But while Portugal was drained of its best men, hordes of negro slaves were imported to fill the vacancies especially in the South. "It would have been interesting to learn the views of Senhor de Braganca Cunha upon the subject of miscegenation which some authorities have credited with a bearing upon the case," wrote the London daily, the *Pall Mall Gazette*, suggesting the short brilliance of the Portuguese in history as a phenomenon worthy of investigation. The Portuguese intermarried freely with the slaves and this infusion of foreign blood was, indeed, one of the most remarkable phenomena following the Age of the Heroes and one of the most momentous in its results. A degenerate race of half-castes was bred in the very heart of the Empire, while citizens of Portuguese blood, proud of their allegiance to the Portuguese throne and the right to the Portuguese flag, in dying to Portugal lived to mankind.

Portugal was long deprived of her colonial supremacy but her flag still flies in Africa and Asia, and these remnants of an Empire which found itself reckoned in history as the "Empire of Lost Opportunities" have even in her decline contributed something to her distinction. The Portu-

guese still speak of their remaining possessions in India as the "brightest jewels in the Portuguese diadem," but they use a metaphor which has come down to them from days which have long passed away.

What Vogel said in 1860 is still not inapplicable to the Portuguese colonies. "From whatever point of view one regards the Portuguese colonies, their present condition," he wrote, "appears more deplorable than that of the mother country. Their economical century is three centuries behind hand and the former grandeur of the Portuguese dominion in the Indies has left no traces but ruins. The invariably weak and imperfect development of their natural resources has not only remained stationary but everywhere it languishes for want of hands, industry and capital. The administration is badly ordered and too much abandoned to itself. The restraint of a vigilant and vigorous control is wanting. The elements of which it is composed are not entirely free from the reproach of venality and cupidity and they do wrong through want of energy and enlightenment"(a). The truth is that Portugal has not opened her eyes to a fact she still ignores; that Portugal cannot hold the heritage bequeathed her from a distant past, unless she expands her dominion from historic settlements, and outlines a policy consistent with the laws of colonial government or of political economy—a policy which will not lead to the flight of thousands of emigrants from Portuguese India to foreign lands. The jealous and monopolizing spirit which governs the conduct of Portugal towards her dependencies, has only served to enrich her rivals and retard their industrial development. Ferreira d'Almeida, however, proposed in Parliament the sale of Portuguese possessions which he thought increased Portugal's embarrassment rather than add to her prestige. The ex-Minister of Marine and Colonies had no argument to produce but that "colonies do not pay." Things were in this posture when the implantation of the Portuguese Republic came to announce that the new movement of regeneration under republican auspices, would inspire the Portuguese in the Continent with an appreciation at once proud and fond of those kindred communities from which they are divided by oceans but

(a) Vogel Le Portugal et les Colonies, Paris, 1860.

no longer by sentiment. The Revolution of 1910 was proclaimed as a new era in the Portuguese colonial history; a new and better order of things was announced and the colonies were promised colonial autonomy. But the disillusion which followed was sudden and complete. The Republic, people hoped, would lay bare the wounds of the Portuguese parasitism with a view to their treatment and cure. But the Portuguese Revolution had produced hundreds of "heroes" who in any country would have furnished the subject for a comic opera. The most promising shooting became an act of heroism worthy of Albuquerque, Castro and Pacheco in the everyday language of the Republican Press. They had to be accommodated. Duarte Leite, the Republican Minister of Finance, dramatically announced that he was unable to pay the "enormous salaries" assigned by the Revolutionary Government to the so-called "heroes" and others who prefer living upon politics to earning a livelihood by honest industry. Anyway, the Colonies soon discovered they were doomed to be an asylum for the vast and rapacious tribe of functionaries who devour the revenue of the State and the resources of the Colonies.

Comedy was, moreover, mingled with tragedy. The Portuguese Republicans precipitated themselves into the policy of an out-of-date Jacobinism. If any proof were needed that the real moving spirit at the back of the Republic was fanatically Jacobin, it would be found in the words of the Republican Minister who drafted the recent Separation Law of Church and State. He openly declared that "within three generations after the passing of the Separation Law, the Catholic religion will be annihilated in Portugal." These utterances need no comment. They recalled of course the inordinate vanity of the ignorant Portuguese knight-errant which appears to exercise so great an influence on the decisions of some Portuguese who still fight moorish phantoms in some national

assembly or political arena to win no prize but barren honour. Unfortunately the education the greater part of Portuguese politicians receive at the mediaeval University of Coimbra—on the anvil of which the Portuguese are still hammered into statesmen—is of the most cramping and bigoted character that turns them out narrow, intolerant, drunk with power and unscrupulous in using it. Be that as it may, Republican Portugal cut herself adrift as a nation from the Church but wished to enjoy the prestige and influence that came as a gift from Rome. The Portuguese Republicans broke the Concordat without any regard to the good faith due to treaties. But jealous of their prerogative they stooped to claim the rights of Patronage in the East, granted to Portugal in view of Apostolic Bulls dating back to the days of Popes Nicolas V, Alexander VI and Gregory XIII and secured to the nation in conformity with the Canons of the Roman Catholic Church. In other words, they still cling to the Concordat signed in 1859 which was slightly modified in 1886 by which it was agreed that the Portuguese rights of Patronage should be exercised as regards India and China over the Cathedrals of Goa, Cranganore, Mylapore, Cochin and Macau.

Such is the plight of the Portuguese Colonies, remnants of an Empire which drew some of the Mother Country's best blood and which is still regarded with a certain patriotic reverence as the best episode in Portuguese history. The Portuguese, to whose hands are now committed the destinies of the country, are perhaps to be commiserated even more than they are to be blamed. This sentiment of pity will, I am sure, gain strength as in the development of the Portuguese tragedy, it shall hereafter appear how in deluding themselves they have failed to delude anybody else.

V. de BRAGANCA CUNHA.

THE PLACE OF WOMEN IN JAPAN

BY RAI SARAT CHANDRA DAS BAHADUR.

BABYHOOD.

TO the Japanese the birth of a baby, whether it be a girl or a boy, is the cause of much rejoicing. As soon as the event takes place, a special messenger is sent to notify relatives and intimate friends. All persons thus notified must make an early visit to the new-comer, taking with them some present. Toys, pieces of cotton, silk, crepe for the baby's dress are regarded as suitable. Before the seventh day the baby receives its name. There is no special ceremony connected with it. The household keep a holiday in honour of the event. A festival dish of rice cooked with red beans denoting good fortune is partaken of on the 7th day. The father usually names the child. Names of beautiful objects in nature, such as plums, snow, sunshine, lotus, lilies, gold, &c., are commonly used for girls, while boys (generally among the lower classes) are given the appellations of stone, bear, tiger, &c.

The distinction between the dress of the boy and the girl is marked even in babyhood. A very young baby wears red and yellow, but soon the boy is dressed in blues, greys, greens, and browns; while the little girl still wears the most gorgeous of colours and the largest patterns in her garments, red being the predominant hue. The sex, even of a young baby, may be distinguished by the colour of its clothing.

To the Japanese the normal way for a baby to sit is with its knees bent under it, and so, at a very early age the muscles and tendons of the knees become flexible. The girls continue this habit of sitting on knees to young and old age but boys learn other methods of sitting as on chairs or squatting on the floor on cushions, but women never change their method of sitting, which must always be on the knees.

The Japanese baby's first lessons in walking are taken under favourable circumstances. With feet comfortably shod in mitten-like sock, they can tumble about as they like, with no bump or bruise, upon

the soft matted floors of the dwelling houses which are always devoid of stools, chairs, tables, &c.

After learning how to walk, the baby's first attempts out of door begin with the use of *geta*, a light straw sandal or small wooden clog attached to the foot by a strap passing between the toes. Babies of two or three trot about comfortably in *geta*, though they seem to give insecure footing.

GIRLHOOD.

The Japanese little girl's place in the family is a pleasant one: she is the pet and plaything of father and elder brothers, and she is never saluted by any one in the family, except her parents, without the title of respect due to her position. If she is the eldest daughter, to the servants she is *O Jo Sama*, literally, young lady; to her own brothers and sisters, *Ne San*, elder sister. Should she be one of the younger ones, her given name, preceded by the honorific *O* and followed by *San*, meaning Miss, will be the name by which she will be called by younger brothers and sisters, and by the servants. As she passes from babyhood to girlhood, and from girlhood to maidenhood she is the object of much love and solicitude; but she does not grow up irresponsible or untrained to meet the duties which maidenhood will surely bring to her. She must then learn all the duties that will fall upon the wife and mother of a Japanese household, as well as obtain the instruction in books and mathematics that is coming to be more and more a necessity for the woman of Japan. She must take a certain responsibility in the household; must see that tea is made for the guests who may be received by her parents. Every morning there are the beds to be rolled up and stored away in cells made in a bedside wall, the mosquito nets to be taken down, the rooms to be swept, dusted and aired before breakfast. Besides this, there is the washing and polishing of the *engawa* or piazza which runs

around the outside of a Japanese house between the *shoji* or paper screens that serve as windows, and the *amalo* or sliding shutters, that are closed only at night, or during heavy, driving rains. Breakfast is to be cooked and served, dishes to be washed; and then perhaps there is marketing to be done either at shops outside or from the vendors of fish and vegetables who bring their huge baskets of provisions to the door; but after these duties are performed, it is possible to sit down quietly to the day's work of sewing, studying, or whatever else may suit the taste or necessities of the housewife. Of sewing there is always a good deal to be done, for many Japanese dresses must be taken to pieces whenever they are washed, and are turned, dyed, and made over again and again, so long as there is a shred of the original materials left to work upon.

As our little girl emerges from babyhood she finds the life opening before her a bright and happy one, but one hedged about closely by the proprieties, and one in which, from babyhood to old age, she must expect to be always under the control of one of the stronger sex. Her position will be an honourable and respected one only as she learns in her youth the lesson of cheerful obedience, of pleasing manners and of personal cleanliness and neatness. Her duties must be always either within the house, or if she belongs to the peasant class, on the farm. There is no career or vocation open to her! She must be dependent always upon either father, husband or son, and her greatest happiness is to be gained not by cultivation of intellect, but by the early acquisition of self-control, which is expected of all Japanese women to an even greater degree than of the man. This self-control must consist not simply in the concealment of all the outward signs of any disagreeable emotion,—whether of grief, anger, or pain,—but in the assumption of a cheerful smile and agreeable manner under even the most distressing of circumstances. The duty of self-restraint is taught to the little girls of the family from the tenderest years; it is their great moral lesson, and is expatiated upon at all times by their elders. The little girl must sink herself entirely, must give in always to others, must never show emotions except such as will be pleasing to those about her: this is the secret of true politeness and must be

mastered if the woman wishes to be well thought of and to lead a happy life. The effect of this teaching is seen in the attractive but dignified manners of the Japanese women, and even of the very little girls. They are not forward nor pushing, neither are they awkwardly bashful; there is no self-consciousness, neither is there any lack of *savoir faire*; a childlike simplicity is united with a womanly consideration for the comfort of those around them.

MAIDENHOOD.

In the opinion of Lafcadio Hearn, the celebrated writer on Japan, a Japanese woman is "the sweetest type of woman the world has ever known." Now-a-days in Japan maidens generally remain engaged in study in Colleges and Schools. Among the humbler classes in farms and villages the maidens have domestic works to do. Leisure they have little. There is washing too, to be done, although neither with hot water nor soap; and in the places of ironing, the cotton garments which are usually washed without ripping, must be hung up on a bamboo pole passed through the arm holes and pulled smooth and straight before they dry; and the silk always ripped into breadth before washing must be smoothed while wet upon a board which is set in the sun until the silk is dry.

Then there are the everyday dishes which our Japanese maiden of better and richer class must learn to prepare. The proper boiling of rice is in itself a study. The construction of the various soups which form the staple in the Japanese bill of fare; the preparation of *mochi*, a kind of rice which is prepared at the New Year, or to send to friends on various festival occasions; these and many other branches of the culinary art must be mastered before the young girl is prepared to assume the cares of married life.

But though the maiden's life is not without its duties and responsibilities, it is also not at all lacking in simple, and innocent pleasures.

There are occasional all-day visits to the theatre, too, where, seated on the floor in a box, railed off from those adjoining, our maiden in company with her mother and sisters, enjoys, though with paroxysms of horror and fear, the heroic historical plays which are now almost all that is left

of the heroic old Japan. Here she catches the spirit of passionate loyalty that belonged to those days, forms her ideals of what a noble Japanese woman should be willing to do for her parents or husband, and comes away taught, as she could be by no other teachings, what the spirit was that animated her ancestors,—what spirit must animate her, should she wish to be a worthy descendant of the women of old.

Among these surroundings, with these duties and amusements, our maiden grows to womanhood. The unconscious and beautiful spirit of her childhood is not driven away at the dawn of womanhood by thoughts of beaux, of coming out in society, of a brief career of flirtation and conquest, and at the end as fine a marriage, either for love or money, as her imagination can picture. She takes no thought for these things herself, and her intercourse with young men, though free and unconstrained, has about it not a grain of flirtation. When the time comes to her to marry, her father will have her meet some eligible young man, and both she and the youngman will know, when they are brought together, what is the end in view, and will make up their minds about the matter. But until that time comes, the modest Japanese maiden carries on no flirtations, thinks little of men except as higher beings to be deferred to and waited on, and preserves the child-like innocence of manner, combined with serene dignity under all circumstances that is so noticeable a trait in the Japanese woman from childhood to old age.

The Japanese maiden is, under this discipline, a finished product at the age of sixteen or eighteen. She is pure, sweet and amiable, with great power of self-control and a knowledge of what to do upon all occasions. The higher part of her nature is little developed; no great religious truths have lifted her soul above the world into a clearer and higher atmosphere, but as far as she goes, in regard to all the little things of daily life she is bright, industrious, sweet-tempered, and attractive, and prepared to do well her duty, when that duty comes to her, as wife and mother and mistress of a household. The highest principle upon which she is taught to act is obedience, even to the point of violating all her finest feminine instincts, at the command of father

or husband; and acting under that principle, she is capable of an entire self-abnegation such as few women of any race can achieve.

With the close of her maidenhood the happiest period in the life of a Japanese woman closes. The discipline that she has received so far, repressive and constant as it has often been, has been from kind and loving parents. She has freedom to a certain degree, such as is unknown to any other country in Asia. In the home she is truly loved, often the pet and 'plaything of the household, though not receiving the caress and words of endearment that children in America expect as a right, for love in Japan is undemonstrative. *

WOMANHOOD.

When the Japanese maiden arrives at the age of sixteen, or thereabouts, she is expected as a matter of course to marry. She is usually allowed her choice in regard to whether she will or will not marry a certain man. Marriage is as much a matter of course in a woman's life as death, and is no more to be avoided. If she positively objects to the man who is proposed to her, she is seldom forced to marry him.

The courtship is somewhat after the following manner. A young man, who finds himself in a position to marry, speaks to some married friend, and asks him to be on the look-out for a beautiful

* Kisses are unknown, and regarded by conservative Japanese as an animal and disgusting way of expressing affection.

† To the Japanese, the ideal female face must be long and narrow; the forehead high and narrow in the middle, but widening and lowering at the sides. The hair should be straight and glossy black, and absolutely smooth. The Japanese ladies who have the misfortune to have any wave or ripple in their hair, as many of them do, are at as much pains to straighten it. The eyes should be long and narrow, slanting upward at the outer corners; and the eyebrows should be delicate lines, high above the eye itself. The distinctly acquiline nose should be low at the bridge, the curve outward beginning much lower down than upon the Caucasian face; and the eye-socket should not be outlined at all, either by the brow, the cheek, or by the nose. It is this flatness of the face about the eyes that gives the mildness of expression to all young people of Mongolian type that is so noticeable a trait always in their physiognomy. The mouth of an aristocratic Japanese lady must be small, and the lips full and red; the neck, a conspicuous feature always when the Japanese dress is worn, should be long and slender, and gracefully curved. The complexion should be light,—a clear ivory-white, with little color in the cheeks. The

and accomplished maiden, who would be willing to become his wife. The friend, acting rather as an advanced agent, makes a canvass of all young maidens of his acquaintance, inquiring among his friends; and finally decides that so-and-so (Miss Otenahe, let us say) will be a very good match for his friend.* Having arrived at this decision, he goes to Miss Otenahe's parents and lays the case of his friend before them. Should they approve of the suitor, a party is arranged at the house of some common friend, where the young people may have a chance to meet each other's merits. Should the folks find no fault with the match, presents are exchanged, a formal betrothal is entered into, and the marriage is hastened forward. All arrangements between the contracting parties are made by go-betweens, who hold themselves responsible for the success of the marriage, and must be concerned in the divorce proceedings, should divorce become desirable or necessary at a future time.

The marriage ceremony, which seems to be neither religious nor legal in its nature,* takes place at the house of the groom, to which the bride is carried,—accompanied by her go-betweens, and, if she be of the higher classes, by her own confidential maid, who will serve her as her personal attendant in the new life in her husband's house. The trousseau and household goods, which the bride is expected to bring with her, are sent before. The household goods required by custom as a part of the outfit of every bride are as follows:

A bureau; a low desk or table for writing; a work-box; two of the lacquer trays or tables on which meals are served, together with everything required for furnishing them, even to the chopsticks; and two or more complete sets of handsome bed furnishings.

figure should be slender, the waist long, but not especially small, and the hips narrow, to secure the best effect with the Japanese dress. The head and shoulders should be carried slightly forward, and the body should also be bent forward slightly at the waist, to secure the most womanly and aristocratic carriage. In walking, the step should be short and quick, with the toes turned in, and the foot lifted so lightly that either clog or sandal will scuff with every step. This is necessary for modesty, with the narrow skirt of the Japanese dress.

* Many women still blacken their teeth after marriage after the manner universal in the past; but this custom is rapidly going out of fashion.

The trousseau will contain, if the bride be of a well-to-do family, dresses for all seasons, and handsome sashes without number; for the ever-changing fashion of Japan, together with the durable quality of the dress material, make it possible for a woman, at the time of her marriage, to enter her husband's house with a supply of clothing that may last her through her life time. The parents of the bride, in giving up their daughter, as they do when she marries, show the estimation in which they have held her by the beauty and completeness of the trousseau with which they provide her. This is her very own; and in the event of a divorce, she brings back with her to her father's house the clothing and household goods that she carried away as a bride.

With the bride and her trousseau are sent a great number of presents from the family of the bride to the members of the groom's household. Each member of the family, from the aged grandfather to the youngest grandchild, receives some remembrance of the occasion; and even the servants and retainers, down to the *jinirikisha* men, and the *betto* in the stables, are not forgotten by the bride's relatives. Besides this present-giving, the friends and relatives of the bride and groom, send gifts to the young couple, often some article for use in the household, or crepe or silk for dresses.

In old times, the wedding took place in the afternoon, but it is now usually celebrated in the evening. The ceremony consists merely in a formal drinking of the native wine (*Sake*) from a two-spouted cup, which is presented to the mouths of the bride and groom alternately. The drinking from one cup is a symbol of the equal sharing of the joys and sorrows of married life. At the ceremony no one is present but the bride and bride-groom, their go-betweens, and a young girl, whose duty it is to present the cup to the lips of the contracting parties. When this is over the wedding guests, who have been assembled in the next room during the ceremony, join the wedding party, a grand feast is spread, and much merriment ensues.

On the third day after the wedding, the newly married couple are expected to make a visit to the bride's family, and for this great preparations are made. A large party is usually given by the bride's parents either in the afternoon, or in the evening in

honor of this occasion, to which the friends of the bride's family are invited. The young couple bring with them presents from the groom's family to the bride's, in return for the presents sent on the wedding day.

The festivities often begin early in the afternoon and keep up until late at night. A fine dinner is served, and music and dancing, by professional performers, or some other entertainment, serve to make the time pass pleasantly. The bride appears as hostess with her mother, entertaining the company, and receiving their congratulations, and must remain to speed the last departing guests, before leaving the paternal roof.

Within the course of two or three months, the newly married couple are expected to give an entertainment, or series of entertainments, to their friends, as an announcement of the marriage. As the wedding ceremony is private, and no notice is given, nor are cards sent out, this is sometimes the first intimation that is received of the marriage by many of the acquaintances, though the news of a wedding usually travels quickly. The entertainment, held at some tea-house, is similar in many ways to the one given at the bride's home by her parents.

Besides the entertainment, presents of red rice, or *mochi*, are sent as a token of thanks to all who have remembered the young couple. These are arranged even more elaborately than the ones sent after the birth of an heir.

The young people are not expected to set up house-keeping by themselves, and establish a new home. Marriages often take place early in life, even before the husband has any means of supporting a family; and as a matter of course, a son with his wife makes his abode with his parents, and forms simply a new branch of the household.

The only act required to make the marriage legal is the withdrawal of the bride's name from the list of her father's family as registered by the Government, and its entry upon the register of her husband's family. From that time forward she severs all ties with her father's house, save those of affection, and is more closely related by law and custom to her husband's relatives than to her own.

At present in Japan, the marriage relation, unlike that in olden times, is by no means a permanent one, as it is virtually

dissoluble at the will of either party, and the condition of public opinion is such among the lower classes, that, it is not an unknown occurrence for a man to marry and divorce several wives in succession; and for a woman, who has been divorced once or twice to be willing and able to marry well a second or even third time. Among the higher classes, the dread of the scandal and gossip that must attach themselves to troubles between man and wife, serves as a restraint upon a too free use of the power of divorce; but still, divorces among the higher classes are so common now that one meets numerous respectable and respected persons who have at some time in their lives gone through such an experience.

One provision of the law, which serves to make most mothers endure any evil of married life rather than sue for divorce, is the fact that the children belong to the father; and no matter how unfit a person he may be to have the care of them, the disposal of them in case of a divorce rests absolutely with him. A divorced woman returns childless to her father's house; and many women, in consequence of this law or custom, will do their best to keep the family together, working the more strenuously in this direction, the more brutal and worthless the husband proves himself to be.

The ancestor-worship, as found in Japan, the tracing of relationship in the male line only, and the generally accepted belief that children inherit their qualities from their father rather than from the mother, make them his children and not hers. Thus we often see children of noble rank on the father's side but ignoble on the mother's, inherit the rank of their father, and not permitted even to recognize their mother as in any way their equal. If she is plebeian, the children are not regarded as tainted by it.

In the case of divorce, even if the law allowed the mother to keep her children, it would be almost an impossibility for her to do so. She has no means of earning her bread and theirs, for only a few occupations are open to women, and she is forced to become a dependent on her father, or some male relative. Whatever they may be willing to do for her, it is quite likely that they would begrudge aid to the children of another family, with whom custom hardly recognizes any tie.

COMMENT AND CRITICISM

Laissez Faire in Indian Evolution.

I find from Mr. P. N. Bose's observations in the September number of the *Modern Review* that my article on his "Illusions of New India" has failed to please him, and I am not surprised. It is true that I have sometimes quoted him in support of my views, which are often precisely the views which he condemns. I may add that about half a dozen extracts in his book in praise of Indian civilisation, or depreciating Western civilisation, may be traced to articles contributed by me to the pages of this Review, and I refer to this only to show that just as Mr. Bose knows all about western civilisation and rejects it, so I may claim to know something about the greatness of Indian civilisation, and may yet desire to improve it by grafting on it what appears to me best in European civilisation. To know both sides of a case is not to accept them as equally true, for that would be absurd, and by pointing out that Mr. Bose occasionally recognised the seamy side of Indian life I never intended to convey that he was not thoroughly convinced of the superiority of Indian civilisation as a whole.

It is quite true that I have no first-hand knowledge of Europe like Mr. Bose, but on his own showing I have a more intimate and up-to-date knowledge of rural life in Bengal than he possesses, and I have travelled, though not extensively, in other parts of India. So far as I know, Mr. Bose moves in a higher,—or if Mr. Bose is too modest to admit it, then I shall say, a different—circle than myself, which is also more removed from the social life of the orthodox rural community than mine. Under the circumstances, I cannot but think that it is distance which lends enchantment to his view, and evokes the panyrics on Oriental civilisation of which his book is full.

I yield to none in my patriotism, for I spring from the soil of mother India, and it is my fervent hope to see my motherland great and glorious. Not for worlds would I abjure my national individuality and the cultural traditions of my race, an admirer of Western civilisation, in some of its aspects, though I am. I have seen too many instances of the indifference of orthodoxy to the humiliation of the national religion or the racial culture to imagine that blind conservatism is really more patriotic than reasoned admiration. Neither am I so obsessed by the glamour of Western civilisation as to ignore the grave evils that accompany it, and perhaps in my daily life and habits I shall be found to have come less under Western influence than even such a doughty champion of Indian civilisation as Mr. Bose himself.

I have read all the three books referred to in Mr. Bose's criticism of my article. I may say at once that I agree with much of what he says, and I can quite conceive the force of the argument that the dangers and the shoals ahead which he points out had to be pointed out, and the warnings he gives had to be given, in order to prevent us from losing our balance and rushing into a mad career of imitation. But though I often agree with his presentation of facts, I

emphatically demur to his conclusion, which, stripped of verbiage, is nothing short of this—hold fast to all that is, and don't try to improve what you have by borrowing from the West, lest you destroy the good with the bad, and get nothing substantial from the West into the bargain. That this is the sum and substance of his teaching, will also appear from his criticism of my article. Here he dwells on the extreme difficulty of determining what is good or bad in any civilisation, owing to the excessive complexity of sociological phenomena. But does it follow that we should desist from the investigation, and leave things as they are? This, however, we simply cannot, for whether we will it or not, things *will* move, circumstances *will* change, and the changes *will* have some effect on us. Is it the part of wisdom to let things take their course, instead of trying to control and regulate the movement to suit our special needs? Hindu civilisation has always absorbed something from its environments—in fact its elasticity and genius for assimilation have been regarded as important factors in its survival through the ages. The pre-Buddhist Brahmanism was very different from the Hinduism of the post-Buddhist age. During the long Muhammadan regime, we were largely influenced by our rulers in dress, speech and manners, and even our social customs underwent some modification. Some of the proud Rajput houses entered into matrimonial alliances with the Moguls without giving up their religion. Mr. Bose, in his "Epochs of Civilisation," tries to minimise the Muhammadan influence, but Sir Henry Elliot, in the preface to his monumental work on the historians of the Muhammadan period, says that even the Hindu historians of the times used to call their co-religionists 'infidels,' and speak of 'the light of Islam shedding its refulgence on the world.' No wonder that he calls them 'a slavish crew.' The process of imitation and absorption will therefore go on in spite of ourselves, and the only question is, whether it should be conscious or unconscious. To me it seems that the only way of making the contact of the West with the East fruitful of the best results for ourselves is consciously to guide the process of assimilation in our own interests.

I admit that evolution is sometimes regressive, but I do not therefore doubt the progressive character of evolution as a whole. The world spins for ever round the ringing grooves of change, and it is not surprising that there should be back-currents and eddies here and there. The Yuga doctrine of the Hindus, according to which we are deteriorating in geometric progression in this *Kali* age, is emphatically *not* the doctrine which will make for our salvation. In fact, to it, and to the fatalism of our popular philosophy, must be ascribed, in no small degree, our present sad condition. So long as Europe was in the grip of the blighting theological doctrine of the radical corruption of man, it was in no better plight than ourselves, but since the days of Comte the idea of the progress of Humanity has taken firm hold of the European mind, and has transfused it and given it a truer, brighter, and more fruitful outlook. Lord Morley in his latest essay recognises the regressive undercur-

rents prevailing in progressive human societies, but does not deny the generally progressive character of social evolution. Mr. Bose speaks of the 'moving or dynamic' equilibrium of Hindu society. This expression does not involve a contradiction in terms only it and in so far as we recognise that there can be nothing like stable equilibrium in human society, and that social equipoise is like two straight lines in space, which always tend to but never meet. In the same way society is everywhere trying to harmonise all its conflicting elements and reach an equilibrated condition, and at the same time it moves on, so that it is always trying to establish a state of stable equilibrium, but never actually does so, one element or the other preponderating in its composition.

Mr. Bose admits that the standard of living in old India was not quite so simple and primitive as some imagine. Quite so. The refinements of luxury which prevailed in the last great Hindu Kingdom of India, Vijaynagar, in the sixteenth century, before Moslem influence penetrated into southern India, have been well described by Sewall from contemporary Portuguese records, and show that when Hindus were great, they could fight as well as enjoy life, and produce men like Sayana and Madhva whose intellectual achievements any nation might be proud of.

As for Western materialism, I find that Sir Rabindranath, in a recent interview with a special correspondent of the *Manchester Guardian* at Tokio, says as follows:—

"Do I think that Eastern thought, the Eastern outlook can be reconciled with the mechanism of Western civilisation? I think it can and must be. In the East we have striven to disregard matter, to ignore hunger and thirst, and so escape from their tyranny and emancipate ourselves. But that is no longer possible, at best for the whole nation. You in the West have chosen to conquer matter, and the fine task of science is to enable all men to have enough to satisfy their material wants, and by subduing matter to achieve freedom for the soul. *The East will have to follow the same road, and call in science to its aid.*" (The italics are mine).

Mr. Bose asks us to stick to our simple standard of living, as it would be 'suicidal' for poor India to imitate the Western standard, for it would retard the growth of our indigenous industries. But if we keep to our simple scheme of life, the industries will not advance beyond their Vedic prototypes, and Mr. Bose himself admits that cottage industries cannot stand before Western machinery. Besides, with increasing wants will come the desire to remove them, and the desire will lead to action, and will in the end enable us to get rid of poverty. When the Hindu race is committing suicide by giving such generous hospitality to famine, plague, and malaria, and driving out large numbers from its pale by obnoxious social customs, when the birth-rate, as compared with the death-rate, handicaps it so heavily in the race of life, when the expectation of life both among males and females—and among Indian females the standard of of living is certainly not yet high—has been found on calculation to be at birth just one-half and even less of what it is in England, why fear so much the prospect of suicide from a rise in the standard of living alone? People will surely give up luxury when faced with starvation and death, but before they do so, they may perchance be led to make a supreme effort to raise their income, and thus solve the problem of poverty. Besides, a high standard of living connotes sanitary environments,

good nourishment, and sufficient protection against the inclemencies of the climate, and all these make for healthy growth.

The more I study the social organisation of India for the last ten centuries, the more do I feel convinced that the village community has got more praise from men like Munro, Metcalfe, and Elphinstone than it deserved; or rather, that they have emphasised only one side of it. H. G. Keene, an observant student of this period of Indian history, says that it no doubt facilitated the preservation of ancient customs and usages and thus helped to maintain the integrity and secure the continuity of the racial traditions, but that it had also 'its wholly deplorable side,' the unprogressive character of Indian society being largely due to it. "In a rejection of external influences and of the efforts necessary to adapt itself to their action, Indian society has shown a culpable negligence from which it has greatly suffered." The *Chach nama* is a contemporary record of the earliest Mussalman (Arab) invasion of Sind at the commencement of the eighth century. From it we find that all the Brahmins at the capital of the kingdom were employed to betray their countrymen, and bring them under Moslem rule. This service the intellectual leadership of the Brahmins enabled them to perform down to the times of Hyder Ali of Mysore, as I have found from contemporary publications which I have come across. The first two volumes of Elliot's History containing accounts of the Arab, Ghaznavite, and Ghorian invasions of India from the pen of Mahamudan historians, are deeply painful reading to Hindus. The massacres and plunders, the pillages of holy shrines and the humiliating fate of their idols, the reduction of millions of men, women and children to slavery, their forcible conversions and marriage, the immense wealth removed from the country,—all this was the permanent feature of the sacred land of Aryavarta, the holy Madhyadesha of Manu where the black antelope roamed, during the two centuries when Hinduism first came into contact with the forces of Islam; and yet Hinduism heeded not these dire catastrophes—'one rural generation dreamt out its existence after another, and all was forgotten;' the great Hindu text-writers some of whom were born during the subsequent political upheaval, went on elaborating their penances and absurd and fantastic rituals; and, in the eloquent language of Sir William Hunter, "dynasties struggled and fell, but the bulk of the people evinced neither sympathy nor surprise, nor did the pulse of village life in Bengal beat faster for all the calamities and panic of the outside world." The self-contained village communities could not save us from being cornered in our own land, and a reversion to that simple social organisation, even if it were possible in these days of steam and electricity, would certainly not contribute to our national solidarity and strength.

The squalor, brutality and degradation of the masses in the West have been described even more graphically by Taine than by Mr. Bose. Taine calls the British slum-dwellers human yahoos. But hard words, after all, break no bones, and the fact remains that with all its high standard of living, there is no death from starvation in Western Europe. We saw only the other day how the accidental death of a few Territorials from heat-stroke near Karachi created quite a sensation in the House of Commons, leading to the dismissal of high European officials in India. Here, Sir John Seeley finds "great populations cowering in abject

misery for centuries together.....if they cannot live, they die, and if they can only just live, then they just live, their sensibilities dulled and their very wishes crushed out by want." Their simple standard of living helps them but little to eke out even a miserable existence on the verge of dissolution. If need be, I would therefore go so far as to say, having regard to the welfare of the race as distinguished from individual members of it: better a brutal existence which can hold its own in the struggle against mortality raging through all Nature, than a docile, commonplace, and featureless existence ready to be blown out at the first blast of adversity; for your soul must have a fleshy tabernacle to thrive in, and so long as the body exists, the soul has a chance, but not otherwise. I know that according to the Evolutionary theory, the morally great are not necessarily physically the fittest to survive, and I shall be the first to condemn that social organisation where the spiritually great are not sheltered from the baneful effects of a weak constitution. I believe in Western countries such men have ampler scope for thriving than in India. Moreover, while in the case of individuals, a frail body does not necessarily prevent his mental growth, in the case of societies at large, physical deterioration leads inevitably to national ruin. Mr. Bose speaks of existing predatory organisations which exhibit the same 'wonderful scientific skill, brain power', &c., as the belligerent nations of Europe. I know of none such, and Mr. Bose mentions none. The point to note is that the high standard of living does not enervate us, and sap the foundation of our national virility; for the elemental virtues of courage and enterprise, strength and vigour, are as necessary to-day for national well-being as they ever were, and the 'maturity' which has attained the 'rigidity' Mr. Bose speaks of is more consistent with senile decay than with national greatness. We read in the Ramayana (Aranya-Kanda, I) that when Rama visited the great forest of Janasthan in Southern India after his exile, the Kishis who had settled there approached him with a request for protection against the terrible raids of the Rakshasas, adding that by leading a religious life they had become as incapable of self-help as the child in the mother's womb. So long as the whole human race has not attained the ethical stage of civilisation at which India has, according to Mr. Bose, arrived, a position like that of the sages of Janasthan can hardly be said to be conducive to the welfare of the body-politic; it is rather the speediest way to national extinction. Nietzsche is at a discount since the present world-war began and I have elsewhere tried to show that I only half agree with him. Nevertheless, his insistence on manliness is a lesson which we Indians can the least afford to forget. *

I would invite Mr. Bose's attention to a letter of Justice Woodroffe published in the *Bengalee* of the 21st June last, in which he says: "One must allow for free growth; and here some so-called 'orthodox' resistance may have to be overcome. Because bows and arrows were used in the days of the Mahabharata, it is no argument against the use of modern weapons because India did not evolve them. Foreign achievements and culture should be a food for each people—eaten and assimilated.....(It used to be said that Greece derived its art from Egypt; but only an expert archaeologist could detect this origin by examining Greek art in all its stages. In its finished product how different it seems from

Egypt, Hellas having absorbed into herself what she got elsewhere.....In India, there was a good deal of false asceticism and false 'Vairagya' which is nothing but the tired feeling of the surface consciousness.....a good deal of religious renunciation is mere slackness, the tired feeling of an organism which neither truly reacts to life nor is yet strong and sincere enough to truly negate it [this is what Vivekananda used to call our *Tamasie* torpor]..... One must do away with all this. Unless a man is by nature truly a yati who has forsaken the world, let him be truly of it and develop all his powers therein according to his 'Dharma'. This is the Religion of Power which India needs if she is to be herself again."

Lastly, Mr. Bose seems to be too hard on 'the limbs of the law.' If it be permitted to one belonging to that much-abused profession to put in a word in its favour, I may say that the British Courts of Justice have introduced in India a sense of fair dealing and security as between man and man, of equality in the eye of the law, and a love of constitutional methods which have in no small measure fostered the democratic spirit among us. "The habitual enforcement of civil rights is the best possible training for the temperate use of political privileges." I have admitted with regret the evils of unrestricted competition in the profession, but when we think of the judicial methods prevailing in India and elsewhere during the Middle Ages, of the trials by ordeal and the theological obsession of judicial tribunals, we may venture the remark that the ideal of dispensing justice under the village banyan tree by the rule of thumb had its defects. I have not the figures with me now, but I know from personal experience that the vast majority of lawsuits instituted are decreed *ex parte*, and of the rest which are contested, the majority again terminate successfully for the complainant. This does not seem to show that the British judicial system as implanted in India is a failure. It should and could certainly be made cheaper, but for political considerations necessitating the maintenance of a highly paid foreign judiciary; and the revenue from court-fee stamps may easily be considerably reduced. Our publicists speak of British Justice as the mainstay of British rule in India, and they are not far out of the mark. "Effective and expeditious" justice might have been in the days preceding the dissolution of the Mogul Empire, but the manner of its administration was hardly consonant with a high degree of development of the social conscience and public responsibility.

As regards the altruistic virtues of benevolence and charity, a perusal of Lala Lajpat Rai's recently published book on the United States of America is sure to knock the bottom off our conceit. Mr. Rai even holds that charity administered by organisations (as in America) and not by individuals (as in India) is the better kind of charity, in as much as it does not lower the recipient's self-respect. What the combination of scientific methods with humanitarian instincts can achieve even in a field which Mr. Bose seems to regard as peculiarly Indian, may be studied in the pages of that book.

The same writer, contrasting the civilisations of the East and the West, is satisfied with neither, but he adds that if a choice were given him he would prefer the latter to the former, which stand for "the negation of the world, a negation of its

reality, a refusal to face it by renouncing it, a contentment which might bring servility, and an idealism which might end in political bondage, humiliation and disgrace." He goes on to say that with the Hindus, "the choice lies between extinction and Europeanisation, unless they can find out a mean by which they may be able to retain the best parts of both and evolve a new and a more humane civilisation of their own. That is the problem before the East".....It is this problem which I am humbly trying to study and though I have not yet reached any definite conclusions capable of being formulated in the shape of a constructive programme, the little that I have learnt impels me to meet the position arrived at by Mr. Bose with a categorical negative, however much I may admire his learning, patriotism, and the courage with which he expresses his convictions.

POL.

P.S.—Since writing the above I have come across an extract from an article by Mr. Aurobindo Ghose which besides being characterised by the thoughtfulness and brilliance usually associated with the writings of that finished scholar and thinker, is so pertinent to our present discussion that I cannot help quoting a few lines from it. Mr. Ghose says:

The East "is able to nourish the illusion that it has not changed, that it is immoveably faithful to the ideas of remote forefathers, to their religion, their traditions, their institutions, their social ideals, that it has preserved either a divine or an animal immobility both in thought and in the routine of life and has been free from the human law of mutation by which man and his social organisations must either progress or degenerate but can in no case maintain themselves unchanged against the attack of time....It is only when we look close that we see the magnitude of the illusion....As a matter of fact, the double-cycle which India has described from the early vedic times to the India of Buddha and the philosophers, and again from the time of Buddha to the European irruption, was in its own way vast in change religious, social, cultural, even political and administrative; but because it preserved old names for new things, old formulas for new methods, and old coverings for new institutions, and because the change was always marked on the external, but quiet and unobtrusive in the internal, we have been able to create and preserve the fiction of the unchanging East. . . . the Eastern or rather the Indian conservative still imagines that stability may be the true law of mortal being, practises a sort of Yogic 'asana' on the flood of time, and because he does not move himself, thinks—for he keeps his eyes shut and is not in the habit of watching the banks—that he can prevent the stream also from moving on. . . . the hope of the world lies in the rearing up in the East of the old spiritual practicality and large and profound vision and power of organisation under the insistent contact of the West....If therefore the conservative mind in this country opens itself sufficiently to the necessity of transformation, the resulting culture born of a resurgent India may well bring about a profound modification in the future civilisation of the world. But if it remains shut up in dead fictions, or tries to meet the new needs with the mind of the schoolman and the sophist dealing with words and ideas in the air rather than actual fact and truth and potentiality, or struggles merely to avoid all but a scanty minimum of change, then, since the new ideas cannot fail to realise themselves, the future India will be formed in the crude mould of the Westernised social and political reformer and will

turn us all into halting apes of the West." If therefore, we are to avoid the wholesale imitation of the West, we must substitute a wise liberalism for our blind admiration of the past, and learn to recognise the true place of conservatism in a progressive scheme of conscious evolution.

POLITICUS.

This controversy is now closed.—Editor, M. R.

Mr. Gandhi on Ahimsa.

Had Lala Lajpat Rai first ascertained what I had actually said on Ahimsa, his remarks in the Modern Review for last July would not have seen the light of day. Lalaji rightly questions whether I actually made the statements imputed to me. He says, that if I did not, I should have contradicted them. In the first place, I have not yet seen the papers which have reported the remarks in question, or those in which my remarks were criticised. Secondly, I must confess that I would not undertake to correct all the errors that creep into reports that appear in the public press about my speeches. Lalaji's article has been much quoted in the Gujarati newspapers and magazines; and it is perhaps as well for me to explain my position. With due deference to Lalaji, I must join issue with him when he says that the elevation of the doctrine of Ahimsa to the highest position contributed to the downfall of India. There seems to be no historical warrant for the belief that an exaggerated practice of Ahimsa synchronised with our becoming bereft of manly virtues! During the past 1500 years we have as a nation given ample proof of physical courage, but we have been torn by internal dissensions and have been dominated by love of self instead of love of country. We have, that is to say, been swayed by the spirit of irreligion rather than of religion.

I do not know how far the charge of un-manliness can be made good against the Jains. I hold no brief for them. By birth I am a vaishnavite, and was taught Ahimsa in my childhood. I have derived much religious benefit from Jain religious works as I have from scriptures of the other great faiths of the world. I owe much to the living company of the deceased philosopher Rajachand Kavi who was a Jain by birth. Thus though my views on Ahimsa are a result of my study of most of the faiths of the world, they are now no longer dependent upon the authority of these works. They are a part of my life and if I suddenly discovered that the religious books read by me bore a different interpretation from the one I had learnt to give them, I should still hold to the view of Ahimsa as I am about to set forth here.

Our Shastras seem to teach that a man who really practises Ahimsa in its fullness has the world at his feet; he so affects his surroundings that even the snakes and other venomous reptiles do him no harm. This is said to have been the experience of St. Francis of Assisi.

In its negative form it means not injuring any living being whether by body or mind. I may not therefore hurt the person of any wrong-doer, or bear any ill-will to him and so cause him mental suffering. This statement does not cover suffering caused to the wrong-doer by natural acts of mine which do not proceed from ill-will. It, therefore, does not prevent me from withdrawing from his presence a child whom he, we shall imagine, is about to strike. Indeed the proper practice of Ahimsa requires me to withdraw the intended victim from the wrong-doer, if I am in any way whatsoever the guardian of such a child.

It was therefore, most proper for the passive resisters of South Africa to have resisted the evil that the Union Government sought to do to them. They bore no ill-will to it. They showed this by helping the Government whenever it needed their help. *Their resistance consisted of disobedience of the orders of the Government, even to the extent of suffering death at their hands.* Ahimsa requires deliberate self-suffering, not a deliberate injuring of the supposed wrong-doer.

In its positive form, Ahimsa means the largest love, the greatest charity. If I am a follower of Ahimsa, I must love my enemy. I must apply the same rules to the wrong doer who is my enemy or a stranger to me, as I would to my wrong-doing father or son. This active Ahimsa necessarily includes truth and fearlessness. A man cannot deceive the loved one he does not fear or frighten him or her. अमरदान (Gift of life) is the greatest of all gifts. A man who gives it in reality, disarms all hostility. He has paved the way for an honourable understanding. And none who is himself subject to fear can bestow that gift. He must therefore be himself fearless. A man cannot then practise Ahimsa and be a coward at the same time. The practice of Ahimsa calls forth the greatest courage. It is the most soldierly of soldier's virtues. General Gordon has been represented in a famous statue as bearing only a stick. This takes us far on the road to Ahimsa. But a soldier, who needs the protection of even a stick, is to that extent so much the less a soldier. He is the true soldier who knows how to die and stand his ground in the midst of a hail of bullets. Such a one was Ambarish who stood his ground without lifting a finger though Durvasa did his worst. The Moors who were being powdered by the French gunners, rushed into the guns' mouths with 'Allah on their lips,' showed much the same type of courage. Only theirs was the courage of desperation. Ambarish's was due to love. Yet the Moorish valour, readiness to die, conquered the gunners. They frantically waived their hats, ceased firing and greeted their erstwhile enemies as comrades. And so the South African passive resisters in their thousands were ready to die rather than sell their honour for a little personal ease. This was Ahimsa in its active form. It never batters away honour. A helpless girl in the hands of a follower of Ahimsa finds better and surer protection than in the hands of one who is prepared to defend her only to

the point to which his weapons would carry him. The tyrant, in the first instance, will have to walk to his victim over the dead body of her defender, in the second, he has but to over-power the defender; for it is assumed that the canon of propriety in the second instance will be satisfied when the defender has fought to the extent of his physical valour. In the first instance as the defender has matched his very soul against the mere body of the tyrant, the odds are that the soul in the latter will be awakened, and the girl would stand an infinitely greater chance of her honour being protected than in any other conceivable circumstance barring, of course, that of her own personal courage.

If we are un-manly to-day, we are so, not because we do not know how to strike, but because we fear to die. He is no follower of Mahavira, the apostle of Jainism, or of Buddha or of the Vedas, who being afraid to die, takes flight before any danger, real or imaginary, all the while wishing that somebody else would remove the danger by destroying the person causing it. He is no follower of Ahimsa (I agree with Lalaji) who does not care a straw, if he kills a man by inches by deceiving him in trade, or who would protect by force of arms a few cows and make away with the butcher, or who in order to do a supposed good to his country does not mind killing off a few officials. All these are actuated by hatred, cowardice and fear. Here love of the cow or the country is a vague thing intended to satisfy one's vanity, or soothe a stinging conscience.

Ahimsa, truly understood, is, in my humble opinion, a panacea for all evils mundane and extra-mundane. We can never over-do it. Just at present we are not doing it at all. Ahimsa does not displace the practice of other virtues, but renders their practice imperatively necessary before it can be practised even in its rudiments. Lalaji need not fear the Ahimsa of his father's faith. Mahavira and Buddha were soldiers, and so was Tolstoy. Only they saw deeper and truer into their profession, and found the secret of a true, happy, honourable and godly life. Let us be joint sharers with these teachers, and this land of ours will once more be the abode of Gods.

M. K. GANDHI.

Jain Ahimsa.

Jainism occupies the foremost place amongst the Ahimsaist religions. Ahimsa Paramo Dharma is the watch-word of Jains. It is said that this Ahimsa has been a cause of the degradation of India or at least of the Jains. How can a people who regard it sinful to kill an ant defend themselves against the tyranny of a tyrant or the attacks of a ruffian? This is the argument put forth to show that Jains are a meek people born to suffer whatsoever fate or fortune may bring to them. This view, I submit, is based neither on any knowledge of the Jain principles of Ahimsa nor on the history of Jains. First let us see what history says about them.

There have been Jain kings, generals and soldiers not only mythical but historical as well, and the Jain acharyas make no mean mention of them in their sacred books, they do not call them (Mithyavadi) or heretics because of the blood they shed in wars. There have also been persons although not admitted by history but recognised as Jains in the Jain Shastras, who took part in the fiercest wars of those times—Chakravarties who fought for empires.

History shows that Chandra Gupta Maurya, the renowned emperor of Northern India was a Jain. His terror was enough to lead Selucus to make a treaty with him—"it is not wise to be on bad terms with

such a mighty foe." This was in the 4th century B.C., only two centuries after the Nirvana of Mahavira, the Ahinsaist teacher. Even in the time of Prithviraj, the armies of one of his foes from Gujrat were led by an Ahinsaist Jain, Bhamashah, the saviour of Alwar, was a Jain Oswal. He laid all his hoarded wealth at the disposal of Rana Pratap, to collect men and munitions for war against the Moghal emperor Akbar, in order to maintain the independence of his Native Land. Agam, Kumarpal, a king of Gujrat (12th Century) had Hemchandracharya the Jain encyclopedist as his Guru; even that Ahinsaist Guru never asked him to retire from his kingly duties so as to escape from Hinsa. These are some of the instances of men whose religion the modern historians have thought it worth their while to mention. India had innumerable kings; what religion they professed can be gathered only from the Shastras, and the Jain Shastras describe many Jain kings, persons of flesh and blood, who reigned over the various kingdoms in Behar, Malwa, Deccan etc.

Even so late as the 16th and 17th Centuries, we find in the Jain Historical Studies by U. S. Tank, in the Indian Antiquary and in Todd's Rajasthan as well as in the household tales of Indian bravery in Rajputana—alas they are becoming scarce with the introduction of modern histories of Rajput defeats and Hindu retreats—Oswal Jains serving their monarchs in the various capacities of generals, ministers and administrators; and for their services they have been awarded hereditary Jagirs and Puttas which exist unto this day. Even now, one finds in the capitals of Rajputana states Mehtas, Bachhawats, and Singhis, gotras of Oswal Jains whose immediate ancestors, i.e. grandfathers great-grand-fathers had led the forces of the Rajputana Chiefs, and the Oswals form an important part, a third of the Jain Community.

Now if we examine the Jain principles of Ahinsa, we find nothing that may make men unmanly and nations degraded and void of self-respect. We quote Jain Acharyas below.

While describing the Ahinsa for a Grihast i.e. a layman Vijay Laxmi Suri says :

आद्यव्रते गृहस्थानां सद्गुणदा विप्रोपकाः

दयाहि दर्शिता मूढैः नाधिका तु प्रकाशिता

i.e. : The sages have prescribed in the first Vrata for a Grihastha one and a quarter Biswa (out of 20 Biswas) of दया (Daya) and *not more*. That is, even the highest Grihastha should observe only one sixteenth of what is prescribed for a Sadhu (who, of course is quite away from all wordly turmoils, and whose business is only to elevate his own soul and to guard the morals of his flock). This is so because, as is explained by various Acharyas, a layman cannot help using water, fire etc, he can not help killing in matters like cooking, digging, house-building, tilling etc (because Jainism does not recommend its laymen to become mere beggars and to depend on others for their daily bread) and because they cannot (for they should not) abstain from using force which involve Hinsa in order that the weak should be protected against the strong and that the aggressor and the usurper, the thief and the scoundrel, the lustful villain and the infamous violator of woman's chastity, the ruffian and the cheat should be prevented from inflicting injustice and doing harm. What is required is that he

should not kill *merely* to satisfy his whim, or for want of ordinary care, or to satisfy his passions. Says Hemchandracharya :

परा कुष्ठकुष्ठित्वादि दद्याद् हिंसा फलं दुष्प्रीः

निरागस्तद जंतुना हिंसासंकल्पतस्तज्जेत

i.e.—Seeing that defect in limbs leprosy etc. are the results of Hinsa a layman should refrain from doing Hinsa with the *determined intention of causing injury without any purpose to innocent moving-living-beings* (जंतु are moving-living-beings as opposed to स्थावर the stationary living-beings e.g. plants, vegetables, etc.) As to the Sthavara the same Acharya says :

निरर्थकां न कुर्वीत जीवेषु स्यादरेषुपि

हिंसामहिंसाधर्मज्ञः कांचन मोक्षमपासकः

i.e.—An Ahinsaist desirous of Moksha should not do Hinsa to Sthavara beings *without any purpose*.

Jain Ahinsa is not the "Perverted Ahinsa of which" as Lala Lajpat Rai says in the July number of the Modern Review, "his grandfather was a believer and which forbids the taking of any life under *any circumstances whatever*." Jains do not believe in that "Extreme Ahinsa" which might "throw in the background all other virtues which ennoble men and nations", "which might throw into shade honor and self-respect," "which might extinguish courage, bravery, heroism, patriotism, love of country, love of family, honor of the race." It cannot be said for certain what Lala Lajpat Rai means by "some good people thoroughly well intentioned and otherwise saintly" who "made a fad of Ahinsa; but certainly Jain Ahinsa does not teach "that it is sinful to use legitimate force for purpose of self-defence, or for protection of our honor and the honor of our wives, sisters, daughters, and mothers." It does not teach us "to guard the honor of those who are under our charge by delivering ourselves into the hands of men who would commit sacrilege."

It is only the innocent beings whom a Jain should not kill. Those who deserve punishment must get the right chastisement and the Jains are free to use the necessary force.

There are Kathas in which even the Sadhus have made use of force for the protection of innocent persons and to save women from sacrilege. In a Jain

Grantha निग्रह-चरिका Chapter X is related a story of Kalikacharya, who, in order to save a Sadhvi from being dishonoured by a prince, caused another prince to bring his forces to her rescue. There is another Katha of a Sadhu, Vishnu Kumar. He himself punished a king who intended to kill all the Jain Sadhus within his empire.

The Jain Ahinsa is not merely a negative precept—"Don't hurt." It is more. It is a positive moral commandment. It says—"Soothe Serve." It is not only "live and let live," "but also "help others to live."

No doubt there are weaknesses in modern Jains. Their community is not very healthy or flourishing. Much work and sacrifice is needed to raise them; and we hope young Jains will not lag in doing their duty, they are already alert. But Ahinsa is not the cause of their weakness. Modern Jains are mostly business men like the non-Jain Vaish Community. It is their contact with this Vaish Community that has

introduced in them most of the evils. We have evidence of the Vaish influence in the social rites and ceremonies of the Jains, most of which are quite inconsistent with Jain Principles. The same influence is at the root of Jain "dislike of force or fear" wherever it exists. It is not an "inherited fear" but "a borrowed fear." The Vaish fear is the indirect result of Brahmanic and Kshatriya supremacy, of the kind found in ancient India, when Vaishas could be treated despotically and with impunity, when they could not even raise a voice against the injustice of their masters for fear of incurring the rage of gods. Jainism recognises no such supremacy of any class nor the anger of gods to punish a man doing any right or just action.

If "India is bereft of manly virtues" it is not Ahinsa, Jain or non-Jain, that has contributed to this result, for we find non-Ahinsaist Indian communities equally void of those virtues. It is the general notion of inferiority of race that has, somehow, got into the Indian head, which is at the bottom of all evil. Give them liberal education. Teach them that their Ahinsaist ancestors achieved great successes in all spheres of life. Teach them that they are not inferior to other nations in every respect and that they are not incorrigibly so, if at all. Then the Ahinsaist nation, the Indian nation shall shine forth in her glory and shed lustre all around. Ahinsa shall make it all the more noble, manly, and glorious.

'AHINSAIST.'

RELIGION AND MODERN CIVILISATION

WITH regard to the question how religion and civilisation stand related to each other, the views maintained by the thinking minds of the modern age may roughly be brought under four classes :—

(i). Advocacy of Religion and opposition to Civilisation.

(ii). Advocacy of Civilisation and opposition to Religion.

(iii). The view that both are necessary but antagonistic to each other.

(iv). Attempts at reconciliation—viewing the two as different manifestations of one and the same spirit.

Let us consider these four stand-points one by one.

I. The first view generally takes the form of idealising the past or the future, and condemning the modern age and modern civilisation as destroyers of morality and religion. It conceives of an ideal state of society in the remote past when religion was the supreme factor in human life, when all the spiritual endeavours of man, science, art, morality, law and political organisation centred round the religious consciousness. In fact what goes under the name of civilisation is itself a child, which has been fostered at every stage of its development by Religion as by a mother. The sciences of chemistry, astronomy, geometry and the arts of poetry, painting and sculpture arose in close connection with the religious practices and ceremonies. The worship of ancestors, the priesthood of the King, sacrificial ceremonies, public assemblies in temples, consultation of auguries

and oracles—these and many other adjuncts of the religious beliefs marked the earliest beginnings of civilised society. All the details of human life were regulated by religious injunctions, which were afterwards compiled in legal codes or scriptures. One might establish this truth about the influence of religion on society by referring to the city fire and the Delphic oracle in ancient Greece, the spiritual conquest of half the world by the Buddhist missionaries, the vast ecclesiastical organisation of Rome, and the civilising activities of Christianity and Mahomedanism, spreading culture and learning, inaugurating moral and social reforms, helping the poor and uplifting the masses through cathedrals and mosques, monks and faquires, poor-houses and caravansaries during the ancient and the middle ages.

Modern civilisation, according to these votaries of religion, is guilty of patricide in so far as it is up in arms against religion, to which it owes its birth and growth. This crime of civilisation against religion is being avenged by Nature, it is said, in the materialistic tendencies of the modern age, as shown in the life of the peoples of Europe and America, in their greed and lust, their mad pursuit of comforts and conveniences, their physical view of human welfare as consisting of the pleasures of eating and drinking, of housing and clothing, bathing and sleeping; their low view of morality which justifies cutting each other's throat, usurping the rights of the weak, depriving the neighbouring states of their liberty; their appli-

cation of the results of the sciences and arts to the criminal end of robbing and killing each other, to the invention of the engines of destruction, reducing cathedrals and universities into ruins, to the exploitation of gold and silver hidden in the bowels of the earth from the more favoured countries, their degradation of divine philosophy into materialism, agnosticism, scepticism and atheism. With all their vaunted progress in science and civilisation, the sum total of human misery on the earth has rather been increased than diminished, as proved by the existence of slums and the white-slave traffic, drunkenness and gambling, adulteration of food and dishonesty in trade, increase of litigation and crime, insanity and suicide, infant mortality and scarcity of milk, the frequent visitations of famine, plague and natural catastrophies. So these religious extremists call the modern age the Kaliyuga (the dark age), and constantly apprehending the approach of the day of judgment and the final dissolution of the world, they turn their back towards the so-called advance of civilisation and retire into the caves and jungles or into the solitary recesses of the inner life, and devote themselves to chanting and singing of hymns, to meditation and prayer with their eyes fixed on the Heaven of Eternal Life or on the Nirvana of Eternal Rest.

II. The other extreme of this one-sided thinking is represented by the votaries of civilisation, who openly confess their enmity towards religion. In the march of civilisation they find the growth of the power and the freedom of the human race, the widening of the sphere of knowledge, the triumph over the forces of nature, the vastness and the permanence of social organisation and what not. Look at the railway trains and the motor cars, the ships and the aeroplanes, the postal services, telegraphs and telephones; think of the electric powers, the mills and the factories; are they not unmistakable proofs of the superiority of the modern age? Are we not making the seas and mountains, the clouds and the wind our slaves? Are we not overcoming space and time, conquering disease and death and liberating ourselves from the tyranny of nature, and of the customs and traditions of society, with the help of the numerous natural and mental sciences? Is not modern civilisation raising man into the rank of God and driving

the gods and goddesses into the regions of non-entity? The religion that you so blindly adhere to is only a product of ignorance and superstition, a child of fear and wonder, a creation of the imagination and dreams, a remnant of barbarism, and is bound to disappear like darkness at the dawn of the progressive civilisation. Our anthropologists and sociologists are collecting materials which convincingly prove the crudity of the origin and the futility of the end of religion. Psychologists are engaged in analysing the phenomenon of religious consciousness and in finding out what percentage of the sense of dependence and the weakness of will must be combined with what percentage of nervous disorder and insanity to give rise to that infirmity of the old age, or that pathological state of mind known as belief in God. Political philosophers are coming forward with their defence of this poor client on the plea that religion has a utility for the masses in so far as it develops the altruistic virtues and suppresses the selfish impulses of man, so that even if there were no God, we must invent one for the sake of political expediency. These extreme opponents of religion base their views on a philosophical system, according to which matter and motion are the fundamental realities, human life is only an automatic machine, mind and thought are nothing but the dancing of atoms, the whole cosmic order is the outcome of the play of blind forces, pushing and jostling with one another, man is the highest product of this world-demon or by far the most successful game ever hit upon by the Life-force in the course of its age-long experiments. According to these thinkers morality can serve as an adequate substitute for religion and ethical societies should take the place of churches.

III. The third class of thinkers realise that both the views represented above have elements of truth, but recognise at the same time that these elements of truth can never be reconciled by human reason and shown to follow from one principle or to lead to the same goal. There is, so to speak, a fundamental contradiction in human nature, because of its belonging to two absolutely different worlds, one sensible and the other super-sensible. Man has an animal life on earth, which is dependent on the physical conditions and the laws of nature. Science and civilisation

are concerned with the study of these conditions and laws with a view to improve man's earthly lot and as such they have certainly some claims on us. But man is also a member of the spiritual world, which is his true home, with which his eternal destiny is linked. Religion is concerned with this second aspect of human life, drawing our attention towards and preparing us for the hereafter. Hence it is that man finds himself at the mercy of two masters,—the world and religion, man and God, science and faith, reason and revelation, both of which are essential to him, however impossible it may be to harmonise them. Those who accept this dualistic position generally divide their mind into water-tight compartments. When they are in the scientific sphere, they give free play to their reason, are acute in their analysis and penetrating in their investigation, they would not accept a single proposition without proof and would confine themselves to the positive and certain relations of coexistence and succession. But when they enter into the religious sphere and put on their Sunday cloak, they are ready to believe in any nonsense and submit to all unreasonable superstitions, from the creation of the earth in six days to the ascension of the dead body of a Jesus. Their attitude towards these two spheres is therefore one of compromise. Here is the positive field of knowledge,—the region of ever increasing light, let us be masters over it; there is the unknown and the unknowable—the kingdom of eternal darkness—let us bow before it—such is their supreme maxim of conduct.

But the human soul cannot rest satisfied with this dualism and inconsistency and naturally seeks for a unity. If it does not find this unity in a harmony or reconciliation of the apparently opposing principles, it must abandon one or the other factor of the opposition and thus identify itself with either of the one-sided and extreme forms mentioned under I and II.

IV. Hence the demand for a synthesis of religion and civilisation to completely satisfy the dialectic of human reason. I propose to attempt a reconciliation of the two.

Religion and civilisation, truly understood, have a common source and origin as well as a common end and destiny. Both arise from man's consciousness of

bondage and finitude and both aim at the attainment of the soul's freedom or liberation and of its realisation of the Infinite. It is only in their corrupt and degraded forms that these two manifestations of the human spirit are found to come into conflict. The extremists of the votaries of religion and the extremists of the advocates of civilisation are each of them right in so far as they point out the defects and imperfections in the other, which result from an unhealthy and diseased condition of the latter, but they are equally wrong in so far as they ignore that there are also elements of infinite value on the other side.

If religion is at a discount in the modern age, it is not so much the materialistic civilisation of the day that is to blame. In fact the term "materialistic civilisation" is itself a contradiction in terms, for the two elements of this complex idea can never be brought together in thought. Civilisation can never be wholly materialistic, as it is always the self-expression of the spirit of humanity in art and literature, in science and philosophy, in social, political and economic life. In civilisation the spirit comes to the knowledge of itself, of its power and glory, through the conquest of matter and physical forces, rising above the laws of necessity and nature-determination, and moulding its own life as well as the life of the universe in which it dwells according to the ideals Truth and Beauty and Goodness. Science and art, morality and religion are the constant companions of civilisation, for they are the various stages or processes through which the spirit transcends its finite character and realises its freedom in nature and society. Civilisation in this sense can no more be materialistic than religion itself. The spirit cannot work in vacuum. It must either overcome, employ and organise material conditions, or reduce itself into an abstract idea, empty nothingness, and attain Nirvana or extinction of life and consciousness through spiritual drill or gymnastic. That is why a religion which divorces itself from the world of matter and life, and occupies itself too much with the disembodied ethereal state of the soul beyond the grave, is in sure danger of losing its hold on the living world and of becoming a dead weight of obsolete rites and ceremonies, and a repetition of meaningless words, till it meets

with natural death or decay and finds its honoured place in the museum of antiquarian researches. If 'civilisation' has become the catch-word of all idealistic and spiritualistic thinkers to-day, it is because they understand by it something more comprehensive and more real than the so-called 'spiritualism' of the historical religions, which are themselves the originators and the supporters of the materialism of the modern age, in so far as they oppose all progress in science and civilisation. For, (i) while all other spiritual endeavours of man are moving with the march of times, religion alone refused to advance even a single step forward in response to the growing needs of the hour and rested content with the so-called revelations made by God to a Prophet or Seer thousands of years ago; she accepted a Veda or a Bible, a Koran or a Zendavesta as the final word of God about the nature of man and of the world, about the history of creation and the destiny of human life. The followers of these historical religions would cling to the superstitious beliefs and erroneous cosmogonies of the scriptures against all the established truths of science, and retard the progress of knowledge based on a free and unprejudiced observation of and experiments on the processes of nature and mind. (ii) Religions maintained a class of priests and elevated them into self-contained and self-sufficient aristocrats, who instead of studying the scriptures and practising a godly life, spread ignorance, propagated false doctrines, forced their selfish claims on a credulous laity, encouraged stereotyped forms and ceremonies, supported the principles of caste and inequality and thereby cut at the root of the communal life. (iii) These fanatic believers fostered sectarian narrowness and dogmatic claims to finality and absolute truth on the part of one particular dispensation; they generated mutual hatred and jealousy, among religions and formulated elaborated codes of dogmas and creeds, stifling the liberty of thought, speech and action which is man's in virtue of his spiritual descent from God; they have blackened the pages of history by the impious persecution and burning of the martyrs who would not give up their honest convictions. (iv.) Religion divorced herself from all those fine arts and innocent enjoyments which make life holier, healthier and more beautiful; she promot-

ed anti-social and ascetic tendencies, which regarding the world as an evil and the social relations as the bondage of illusion turned man away from the home and family life, and led him to the opposite and far more destructive evil of *otherworldliness*; she was responsible for all those evils of impurity and dissolute life which necessarily accompanied monasticism and celibacy in most cases. (v). She produced in the mind of her followers on the one hand a craving for individual salvation which led to an egoistic spirit in all the affairs of the earthly life, and on the other hand a deterministic outlook which naturally led to the inactivity of fatalism and quietism; in either case religion retarded social progress and civilisation.

All these elements which are symptoms of the corruption and the disease of spiritualism in religion have combined to bring about modern materialism, agnosticism, scepticism and atheism.

Paradoxical as it may seem, the scientists, artists and politicians of the modern age have more of the truly religious spirit in them than the so-called missionaries, preachers and ministers who have made religion their special professions. Take for instance the case of the scientist, who is supposed to be as far removed from the sphere of religion as hell is from heaven. A scientific genius must learn to distinguish between appearance and reality, and go out in search of the Unseen, the Beyond, the Rational, which is at the same time the Real; he has to dive beneath the surface of things, to transcend the finite standpoint and go beyond the region of the senses, in order to understand the super-sensible. This however involves on his part: (1) meditation and concentration of mind on the essence of things, as divested from the irrelevant conditions and outer husks of phenomena;—which may be compared to the attitude of worship or communion on the part of religious minds towards the Supreme Being; (2) intense longing for the truth, earnest seeking after whatever may throw a little light on the subject of research—which resembles the religious man's habit of prayer; (3) lifelong devotion to the cause of knowledge, sacrificing all the comforts and pleasures of life, forgetting the self and the world—which is akin to the practise of austere penances and asceticism in the religious life; (4) again, if it is only the pure in heart that can

see God, no less is it true that the secret laws of nature are revealed only to a holy mind, for Nature is a jealous mistress, and an exacting queen who demands absolute chastity and purity of heart, undivided love and attention, utter self-abnegation and self-surrender, before she admits any one to her inner chamber and lays bare the invaluable treasures of her mysterious kingdom. Lastly (5) the scientists' communion with nature is fruitful only so far as he brings himself in line with or is at one with the course of nature, so far as he moves with and not against the current of the spirit, i.e., so far as he goes in the direction of the natural flow of the spiritual life or 'vital impulse' and this means that he must somehow be connected with the centre of the universe, have a deep insight and comprehensive grasp of the whole, or in other words, the whole world must be reflected in his self. Hence it is that all scientific inventions are mere imitations of nature, all scientific discoveries are mere refindings of what is already present within us, and all knowledge is memory, as Plato said long ago. This brings us to the recognition of the important philosophical truth that nature and mind are one, the microcosm mirrors the macrocosm. Now, is this not also the beatific vision or the highest religious experience as described in the writings and utterances of the religious saints and seers? Can we not identify the greatest scientific genius with the profoundest mystic in so far as both see the world in the soul and the soul in the world? If such an attitude of the scientist towards reality is not religion, I do not know what else is meant by religion. The same might be shown to be true of the artist and the statesman. If religion manifests itself in the triumph of the spirit over nature, the discovery of the unseen world of truth and beauty and goodness, the participation by men of the omniscience and omnipotence of God, then it is just under the favourable condition of modern civilisation with its progress in science, art and good government that such a religion is evolving. There is a providential dispensation even in the distribution of scientific, artistic and political geniuses in the human race, and the moral government of the universe is so constituted that only those nations, in which the spiritual life of its members has reached a very high stage of development, can give

birth to a number of seers and originators in science and art, so that physical and material improvements in a society, the progress of the sciences and arts in a nation, are dependent on the progress of the spiritual life of that society or nation. Thus the progress of civilisation means at the same time a higher degree of development of the spiritual principle or the religious consciousness in man. In this sense, a civilisation without religion or a materialistic civilisation is a monstrosity which may find a place in the imagination of some upstart in philosophical dabbling, but has certainly no claim to reality either in the history of human society or in the logical thought of metaphysics.

Such being the relation between religion and civilisation in general, it is worth while enquiring, in what special directions our conception of religion has been influenced and modified by the modern civilisation.

(i) First of all, the modern age has taught us to distinguish the essential from the accidental features of religion, the eternal verities that are the same to-day, yesterday and for ever, from their local and temporal forms and accompaniments. We have learnt now that the essence of religion does not consist in creeds and dogmas nor in the performance of certain rites and ceremonies; it is not to be sought in a faith in heaven and hell, where our virtues are rewarded and vices punished; nor does it necessarily involve a belief in gods and goddesses, in fairies and angels; it is not to be identified with "chanting and singing, and telling of beads," nor with the offering of meals to one's fore-fathers and the feeding of priests and saints, nor does it imply regular attendance in a church or confessions and alms with a view to make provision for the hereafter. No, the essence of religion must be sought elsewhere, viz., in a system of ideas and feelings which regulate the moral life of the individual as well as the spiritual life of society. As I have expressed it in another connection,

"Faith in a *spiritual world* beyond and above the visible world presented to our senses, and faith in a *Just Being* at the centre of this spiritual universe, the recognition of this supersensible kingdom as our true home, and of this *Just Being* as our *Father*—form the centre of the religious system and the root of the religious life, all other ideas and feelings being mere satellites around them or mere fibres that are sustained by them. Religion, pure and undefiled, lifts man beyond the region of shadows and appearances and translates him into a world where all the con-

licts and discords, all the evils and enigmas of our life are reconciled and solved. It affords us the only means of communing with the Higher than the Highest and the Holiest of the Holy. It evokes in our heart the sublimest and deepest feelings of wonder, admiration and reverence, which give birth to science and philosophy, art and morality, hero-worship and devotion to prophets and seers. It inspires us with a faith unshakable in the ultimate triumph of justice, with a hope indomitable for the realisation of our best and highest aims and aspirations. It generates in us an idealistic view of life and things and lends us the moral force of a reformer and the large-heartedness of a philanthropist. Hence the love of truth, purity and freedom, the sympathy for a charity to man and animals, the care for the poor and the homeless, the blind and the cripple, the widows and the orphans, the relief of the depressed, the up-lifting of the down-trodden, the resistance to evils in society, the tending of the sick, the consideration for the weaker and gentler members of the race, meekness and submission to the universal will, the patient endurance of the worries and evils that cannot be cured, the ardent appreciation of all that is noble and holy, even in our enemies, the forgiveness of and the reconciliation with the shortcomings and transgressions of our brethren,—which we find to be constant companions of the religious consciousness."

(*The Indian Messenger*, July 11, 1915).

(ii) All the qualities of head and heart I have just mentioned as the necessary correlates or concomitants of the religious life are at the same time the indispensable conditions for the evolution of human society and the essential requirements for the realisation of a higher spiritual life by the individual. Modern biology acquaints us with the law of evolution which governs the life of the individual and of society. The value and importance of religion according to the scientific minds of the modern age lie in the inculcation and cultivation by it of those virtues in man which enable him to go with the current of the universal life and to rise higher and higher in the scale of being, passing from the stage of animality through the gate of humanity to the rank of angels till he realises his perfection in divinity. As Benjamin Kidd says, religion is the supreme factor in social evolution insofar as it makes the individual subservient to the needs of the race, and insofar as nature selects those races, in which the individuals of the religious type predominate, as the fittest to survive in the struggle for existence, and eliminates those races which develop anti-religious and egoistic tendencies (Social Evolution). Equally important is the part played by Religion in the maintenance of the individual life, for it is the only medicine that can relieve us from the worries, the care and anxieties, from the fear and igno-

rance, the failures and disappointments, dangers and calamities that beset our earthly life. But for the faith, hope, love and spiritual idealism generated in us by religion, our life would have been unbearable. Religion is the staying power which maintains the balance and the equilibrium of the soul, keeping it always true to the centre of gravity which is in God, enabling it to fix its vision on the Infinite and the Eternal and thus to rise above the limitations of space and time.

This conception forces on us at once the recognition of the *vital* necessity of religion for the race and the individual in the biological sense, apart from its intellectual and moral necessity, which has long been realised.

We therefore need not trouble ourselves about the future of religion. The existence of the religious spirit cannot be threatened by modern civilisation, for religion is based on the adamantine rocks of reality and is one of the elemental forces of nature which govern human life and society. It cannot die even if we are indifferent to it. If it is neglected, civilisation will give place to barbarity, man will be replaced by animals; the life of the human race will be extinct from our planet. Such is the verdict of scientists who know the limitation of their sphere and the impotence of mere intellect without religion.

(iii) It may be asked, are not the feelings of wonder, admiration, and reverence, faith in the triumph of justice, hopefulness, the idealistic outlook, love of truth, purity, freedom, sympathy, charity and so on,—I mean, are not all these qualities, which are supposed to be essential to the life of society and of the individual,—possible without religion? Could we not be made fit to survive in the struggle for existence by means of morality alone? What then is the use of concerning ourselves with the transcendental world and asserting our belief in a Supreme Being? This question presses upon us to-day all the more formidably in view of the fact that the greatest world-religion *viz.*, Buddhism, does not seem to attach importance to the existence, or non-existence of a divine father, and also in view of the fact that many of the leaders of modern idealism and rationalism could lead an ideal life of purity, duty and public spirit without caring for God and religion. But, as I have already said, morality, as

well as art and science are alike manifestations of the same principle of spirituality and rationality in man, which reaches its highest culmination in religion. We cannot separate morality from religion; for the latter is the spirit that quickens, perfects and fructifies all those activities which are known to us as moral. A man who is moral is already religious without his knowing it; perhaps his ideal of goodness and purity is a truer substitute and representation of God than the idolator's visible object of worship made of clay or wood. No, in God's world, there is no atheism, although there are different ways of representing the faith in the spiritual principle according to the culture, the temperament, the surroundings, the age and the race of a man. By some, God is identified with mammon; to some the devil takes the place of the Deity; for others, God is represented by a particular metaphysical theory or artistic notion or moral ideal. We can give so wide and comprehensive an interpretation to the term 'religion' as to include all these various classes of man's attitude towards Reality as the different gradations of the manifestation of the religious consciousness. From this standpoint, the moment a man sacrifices himself and his interest for a higher end, the moment he recognises his ignorance and impotence before an external world, which is independent of his will and which offers him resistance at every step, he is already pledged to the belief in God, if he wants to be rational and consistent. In fact our God is revealing Himself in an infinite variety of ways, and training the most confirmed atheist in the most beautiful and sublime lessons of religious experience, by coming to him as his own father and mother, wife and child, and receiving his homage unawares in all forms of domestic duties, friendship and affection, virtuous practice and social service. So unless a man ceases to be a man and becomes a brute, he cannot escape being religious in some form or other, although the value of a man's religion is ultimately to be judged by the nature of the God he believes in or worships.

But we must go further and assert that without an explicit recognition of the specially religious elements of our spiritual life, morality is sure to lose its hold on the mind of man and to meet with decay and death. This admits of proof by reference

to the witness of history as well as to the verdicts of moral philosophers. For (1) although many men of culture in modern civilised societies lead a good moral life without adhering to religion in any form, yet it is undeniable that the advanced stage of civilisation in which morality can stand, unsupported by religion, has itself been brought into existence by long centuries of religious practices and teachings which began with the dawn of human society and were intensified by the rise of spiritual world-religions; (2) unless morality is sustained by the sense of one's own weakness and insignificance combined with a belief in the moral government of the universe and a power that helps us onward and pulls us upward, it runs the risk of bursting its own walls by a vague hankering for an unattainable ideal or degenerating into a refined form of egoism; (3) In religious consciousness alone man has an anticipatory glimpse of his origin and destiny. Man's thirst for the Infinite is at once the proof and the result of his bearing the stamp of his divine origin and the signal of his eternal life in the heart. In other words religion is the light which reveals our own weakness and imperfection and thereby awakens in us the need of salvation or freedom from the bondage of the fleshy vessel in which our spirit is locked up and into which our spirit is likely to be absorbed, unless purified and elevated by moral and religious practices; and religion is also the light that casts its rays upon the distant goal or God, through the right adjustment of our relation to whom alone we can rise to power and glory and to freedom and joy. Hence it is that such thorough-going rationalists in the sphere of ethic as Kant and Sidgwick found it impossible to systematise and rationalise our moral experiences without the help of the theological postulates of God and immortality.

(iv). Another important problem confronting the religious conception of the modern age is, how to reconcile the new facts brought to light and the new explanatory principles formulated by the scientists of to-day, with the old ideas of creation, incarnation, inspiration, miracles and so on, which are necessarily associated with religion. To answer this question would require more space and time than we can afford to spare for the present, but

I shall try to indicate as briefly as possible the line of thought along which the solution of the problem must be sought.

The indispensable minimum of religious faith which we can safely retain as incapable of being shaken by any advance of knowledge and which need not impose any limitation on the freedom of scientific investigation, may be expressed, I think, in the form of three propositions, which are of the nature of postulates, *viz*:—

(1) There is a Power behind phenomena, with an infinite knowledge and with a moral purpose,—a just holy, loving Being, best described as a Person, whom we may call our Father, without ascribing to Him the limitations which attach to human personality. This conception of the Supreme Reality is common to all the higher religions and although not amenable to scientific proof, it is confirmed by philosophical speculation,

(2) There is a spiritual world, beyond and above the Kingdom of nature, a world that is not in space and time and not subject to the mechanical laws, but is rather the supersensible region from which flow the Ideals of Truth, Beauty and Goodness, which are *revealed* to the seers and the prophets and the pure in heart and realised by them in the sensible world.

(3) Man as a spiritual being can enter into a relationship with this spiritual world and commune with the Supreme Being at its centre—*prayer and meditation* being the means of communication between them.

In so far as the human soul identifies itself with God, it is *inspired* with the Ideals of the supersensible world and acquires supernatural powers. Such a man may be represented as a divine *incarnation* in the same sense in which the physical body of every man becomes an 'incarnation' of an indwelling spirit during his life-time.

In support of these three religious postulates I may mention that even the most acute scientists and the most radical empiricists who are unbiassed by any religious prejudices and have approached the dogmas of religion with the spirit of free scientific investigators are now coming to recognise more and more clearly the existence of a guiding, purposing and powerful mind behind the world-machine (*vide* William James's *Varieties of Religious Experience*, L. T. Hobhouse's *Development*

and Purpose' and Sir Oliver Lodge's 'Life and Matter'); where as the reality of the spiritual world and the infinite capacity of the human soul with regard to the realisation of its freedom in the world of nature are finding strong advocates among the leading philosophers of Europe, Eucken and Bergson. The progressive liberal religious movements throughout the world are also coming out triumphant after long years of fruitless controversies on 'Science *versus* Religion' and presenting before the scientific world the old concepts of religion under new forms, so that the ideas of Revelation, Incarnation, Inspiration, Miracles and Immortality are receiving new interpretations in their hands. And yet the modern religious man is far from claiming absolute finality with regard to the truths which concern the details of the three general postulates of Religion stated above. For example, the questions as to how the infinite power brings into being and sustains the world, what His final purpose may be, what the laws of His moral government exactly are, what form of life the soul will live hereafter,—these questions must necessarily remain shrouded in mystery and obscurity, till our sciences and philosophies attain a higher level of development, and till our experiences touch a deeper region of reality.

(v) Lastly, the question that naturally arises after these discussions is, which particular form of religion will survive the stress and the pressure of competition between thoughts and ideas, practices and institutions in the modern world? The answer ought to be evident to any one who has studied the spirit of modern civilization aright. It is the religion which can ally itself with morality, art, science and philosophy, the religion which has a clear vision of the future destiny of man in the light of the past history of his evolution, which will help man in understanding the laws of the development of human society and in gaining mastery over the conditions of his life and growth; the religion which has a deep insight into the spiritual world, a comprehensive grasp of the whole reality; the religion which embraces in its sympathy all the races of mankind and all the departments of human life and activity, the body and the soul, the family and the society, the religion which aims at nothing less than the realisation of the divine will and the establishment of the kingdom of heaven

on earth, the religion which is characterised by universality, catholicity, sociality and spirituality. This is the religion that is going to survive. The existing religions must all undergo greater or less transformations before they can become organically related to this world-religion. But sooner or later the transformations must come and then it will be realised that the small body of the religious liberals in India, who belong to the Brahmo Samaj, had already chalked out the path for approaching the new religion of the new world, and that

the details of local and temporal differences apart, this universal religion had already been revealed in its frame-work to Raja Rammohan Roy and practised and elaborated by generations of mighty souls like Maharshi Devendranath Tagore and Brahmananda Keshub Chandra Sen. Whatever name may be given to this future religion of the world, the religion of the Brahmo Samaj represents its soul, its essence, its spirit.

S. C. Roy

HOW MOTION PICTURES ARE MADE.

THE features of the modern motion picture which are an improvement on the earlier form and which render it adoptable for its present amusement purposes are the production of the images by photography. Twenty years ago the motion picture was a child's play. To-day it is the basis of business, giving profitable employment to millions of people, offering education and amusements to billions, and evolving investment of capital, that places it among the world's greatest industries. The motion picture camera man sets up his whirling camera in the wilds and crowded cities alike. He records the downfall of the kings and the inauguration of the presidents, the horrors of great disasters and the deeds of popular heroes; he spreads before us in moving panorama all that is interesting in nature and in man's work in the drama and in real life.

The flexible negative film permits a large number of pictures to be taken quickly in succession upon a single strip of negative film. This flexible negative film before use in the camera, consists of a long narrow strip of celluloid coated with gelatin photographic emulsion. The transparent support for the positive print or the positive film, permits the pictures to be projected on an enlarged scale upon a screen, so that they may be viewed by the large audiences. Motion pictures were well received by the public from the beginning and the industry grew rapidly from the first.

In the beginning it was sufficient to photograph anything which had a movement and the wonder of the projected feature was sufficient to hold the attention of the audience. The subjects which were confined to travel and science studies and occasional foolish comedies were enthusiastically received by the public; dramas were not then known.

The public soon discovered that the photoplay is more realistic than the plays produced on the stage and that the range of the subjects that can be covered by the film is almost limitless. Instead of using painted sceneries, it is possible to produce the act among the actual surroundings demanded by the play. When the producer needs a ship, he does not build one of painted canvas and a few boards, but goes and photographs the group of players on board an actual ship, that sails on an actual ocean or river. The photoplay fills actually the increasing demand for realism.

Sometimes it is necessary to play deceptions to curtail the expenses of the production, but it is played so cleverly, that very few of the frequenters of the picture theatre can detect it. For that reason the film-producer must be artful for he must get by ingenious contrivances the maximum of effects for the minimum of expense and trouble.

About this time the manufacturers have discovered that the foreign pictures or scenes are attractive to the average show-patrons, with the result that the travel

The "wheel of life," or zootrope, in either form shown here, gave the effect of motion by an optical illusion.

pictures have come into being. The pictures are not only entertaining but are instructive as well.

With the advent of the exclusively motion picture theatre, the demand for the drama grew. It became necessary for the motion picture manufacturer to acquire studios suitable for staging dramas to employ writers to furnish themes for motion picture plays, to employ actors and stage directors to present the theme properly before the motion camera and to employ scene painters and property-men in a manner very similar to the operation of a standard theatre except that the sitting capacity is absent and the play is produced but once in the studio.

Dramatic films which tell the story, through a series of related incidents are equivalent to a drama of the legitimate stage in all its essential details except of course that the action is expressed entirely in pantomime. The incidents in the film drama, like that of the legitimate drama, are based on a story or manuscript, known as scenerio. The players go through the play before the camera as in the ordinary theatrical performance, the camera playing the role of the audience. The interior scenes of these plays are enacted in the studio of the manufacturer. The exterior views are of course taken at the place designed by the scenerio which may be any place south of the Arctic or north of the Antarctic.

All parts of acting and stage fixing are directed by the producer, who is the principle factor in the management of the studios, and in the production of the

plays. From the time that the scenerio first falls into his hands until the negative has been delivered to the developing department he is constantly on the job in directing the work of the players and scenic mechanics. On the receipt of the scenerio the producer makes such additions and subtractions as he thinks necessary and notes the details of the scenes and the property required for the plays. In case of out of door scenes, the producer determines on the proper locality for the action. While all these are in progress, he selects the players and calls for a rehearsal. If the scene to be rehearsed is a studio act, the stage is set completely and the actors appear in full costume. The camera is set in position so that the operator may become familiar with the act, and the rehearsal proceeds. After a number of substitutions and additions made by the producer to improve the scene or to bring it within the time limits of the films, it finally receives his approval and the camera is started. An instant after follows the order, "start your action." The producer now starts his direction to the players "You are out of camera." "Kelly, faster, faster, faster," "cheer up, you with harem skirt, not so far" "roll your eyes" "be more serious" and so on. During the rehearsal the players are either assigned or assume a dialogue that corresponds in a rough way to the pantomime. While the speech is not produced by the projection, it is a great aid in attaining the correct facial expression, and makes the picture much more natural.

If any mistake is made during the

filming of the play, the film is destroyed and the act is repeated until it meets the approval of the producer.

In the case of the out of door scenes the play is generally rehearsed in the studios before going into the field. This practice

THE ACTOR CAUGHT-

IN THE ACT.

An actor is enacting a movie scene for the camera as the staff direct and register what seems to be a very solemn moment.

is always followed in case of the street scenes, where the throng of spectators would interfere with a prolonged rehearsal.

The players are frequently recruited from the theatres. It is customary to hire some actors for a day at a time, because of the fluctuations in the studio demands. One day the producer may require as many as five hundred players and the next day less than one twentieth of that number, depending on the character of the play then being produced. The company maintains a small body of players known as stock company, who are kept continuously in the service of the company at a fixed salary. The selection of actors and actresses is by no means an easy task, for they must not only be the masters of pantomime but must look their part as well. The camera is a merciless critic and exaggerates all the awkward gestures or facial peculiarities of the players, and the defects that would not be noticed on the

stage are glaringly apparent on the screen. It is almost impossible to doctor up a character with grease paint, for the magnification of the projector would make such an attempt ridiculous. It is almost impossible for an old man to take the part of a young or vice versa, which can be done in the legitimate theatre with success.

The company I am working with, as oriental assistant producer, have twenty-six different producers, and each maintains a stock company of its own. The company supplies scenerios and money and the producers make the picture. This company is the largest in the United States giving employment to twenty thousand people everyday. The place where they have their studios and factory is known as Universal City after the name of the company and occupies four thousand acres of land. This company maintains a menagerie of wild animals to produce hunting, wild animals and the African pictures.

The studio is the department of the producer and the factory is the department of the photographer. The factory superintendent or the photographer, does but little of the photographic work, with his own hands. The divisions of his factory, taken in the order in which they become useful in the making of the picture film, are as follows:

The raw sensitive films are purchased, cut to pieces and packed in the tin cans; a fireproof iron safe or iron vault for film storage holds the films until needed. From the vault the film is taken to the perforating room where holes are punched in the edges. Thence the negative film goes to the camera-man, who is the photographer's assistant, working under the order of the producer. From the camera-

and spliced up according to copy, the film negative goes to the printing room and supplies of positive films also go from the perforating room to the printing room, where the positive film is printed from the negative. The negative after all prints are

THE CAUSE.

splicing room, and again to the fireproof storage vault, until the day for packing and shipment.

In brief the division of the photographer's factory are film storage, perforating, camera title making, developing, printing, washing and drying, inspecting and shipping. The total task of the photographer is to produce a creditable photographic film picture, when the producer has enacted the scenes and has written the titles. This task requires the photographer to have

THE BIRTH OF A FLOWER.

his assistant the camera-man present, when the producer enacts a scene, and leaves the responsibility upon the photographer through his assistant, the camera-man, for the proper photographic record of the scene, upon the negative film of the camera.

TRICK CINEMATOGRAPHY -THE AUTOMOBILE ACCIDENT.

This is done by 'stop and substitution' method, the principal actor is made up as a double of a cripple. Here the actor is being replaced by the legless cripple with the dummy legs. The Taxicab will run over and displace the legless cripple's property legs.

The division of responsibility at this point is logical. If the negative is lost because the camera-man used the wrong stop in the lens, the failure is photographic in nature and the photographer is to blame because of the incompetency of his assistant. From this point to the delivery of the film for shipment the process is wholly photographic. The photographer assigns his camera-man to the producer as demanded, providing him with the negative film, and delivers proof print to the producer for criticism. From the approved proofs and the picture copy, the photographer prints finished film pictures as requested and delivers them by shipping them under salesman's order.

The field for the motion picture industry is unsurpassable, because it controls indefinite lives, and is more realistic than the legitimate drama. Merely on account of its educational value it will never grow old. "No device ever within the brain of man has such boundless educational, mind-transforming potency and powers, as the

projection of moving pictures on a screen, where all can see. It will actually surpass literature in almost supreme power."

Motion pictures have entered into the educational programme of modern American and European schools and universities. Our people might call it the motion picture theatre university, or the picture civilizer; but its influence is real and sure just the same. People like pictures and they like stories, and the motion picture drama being a picture story, has therefore a double reason for its popularity, it is the latest in the series of human inventions which have made human history.

Young people as well as old can better remember history and mythological stories if the actual occurrence can be presented before them, than by merely reading the incidents. Historical scenes can be taken in the actual place of occurrence. Being a picture story this is extremely amusing and interesting even to the illiterate and common people.

The establishment of a motion picture producing company in India, will not only bring immense profit but will aid in the education of the people, and will provide work for thousands of the starving poor. If we go after it cautiously and sagaciously, we shall succeed, because the demands

WHERE THE PHOTO PLAY BEST THE STAGE DRAMA.

for the foreign pictures in the occident, specially for the oriental, is enormous, and also we have a great field in our own land. The production of oriental pictures in the orient will cost one-twentieth of the sum required to produce them in America, and can be made more perfect and pleasing to the occidental eye. American people think that all orientals are alike, they cannot make any discrimination between the Arabs and the East Indians, and Hindus and Mohamedans, though they are always willing to make pictures as perfect as possible under the circumstances.

The tropics are the ideal place to take the best motion picture, specially India, according to the report of the Pathe Frere, the foremost authority on the subject. A prominent film-manufacturing company, operated for years, without studios and painted scene sits, releasing a reel each week. On several occasions the film-manufacturer, whose headquarters and factories are located in the northern hemisphere have sent producing companies to the tropics in the winter, when many

complete dramas have been produced, before the camera, without studio and without artificial scenery. The beauty and attractiveness of a motion picture is enhanced by avoiding painted scenery and their artificial appearance, whenever possible. No painted scenery can equal the details and accuracy of the natural objects.

The few small companies, who are working on this line in India, can do better, if they can push their goods through the American market. It might seem a little hard in the beginning, but it could be done just the same with a little exertion. The American public always goes in for the novelty without caring what it is and is ready to pay enormous prices, specially for anything concerning the mysterious orient. Here is the chance for our picture film manufacturers to establish their companies on a firm basis, the only requisite is a little enterprising spirit. They ought to do it before it is too late, because many of the American film manufacturing companies are contemplating to start the oriental branch of their studios in India right after the war is over. Only in the city of Los Angeles, ten oriental, specially East Indian, film features (dramas) are being released every week; in the whole United States, not less than two hundred oriental features are being produced every week, and these are being directed and acted by the Americans, who are fully ignorant of the oriental characteristics. American people always love realism, all these releasing companies are fully aware of this fact, and are always willing to get real things. Having been interested in this subject, I am well known among the "movie circle," specially with some of the biggest releasing companies. These companies have always expressed their desire to buy some genuine oriental features. It is customary with these companies to witness the feature on the screen before the deal. If it is satisfactory

and reliable they are ready to pay a very big price and will make contracts on a weekly or monthly basis. Any person who is willing to push his goods through the American market, may communicate with me, or send a few reels of their positive films; I will do the rest very willingly to represent my country to the Americans; and will be able to say: "We are not so backward as you think."

The routine of manufacturing and selling motion pictures, can be compared very closely, with the routine of printing and selling a newspaper or a magazine. The amusement business is established upon a weekly or daily basis, in theatrical circles a year being spoken of as fifty-two weeks and a day as one-seventh of a week. The big theatres change their bills at the end of the week and vaudeville programs are changed weekly. Similarly in the motion picture theatres the program is made upon the weekly basis. The film-renter makes his schedule upon the weekly basis, and it best suits his convenience to receive his films from the manufacturer upon a weekly schedule. As the businessman gets his newspaper every morning, so the prominent daily change motion picture theatre gets its new film from the renter, who in turn gets the film every morning from the manufacturers. Orders are placed by the renter on the basis of weekly deliveries, that his schedule may run smoothly.

In view of the deliveries required by his customer of the renter, the manufacturer is obliged to issue his pictures as regularly and as punctually, as a publisher issues his newspaper. Each film manufacturer therefore establishes one or more less release days for each week according to the number of reels of films which he will manufacture per week, and advertises, that a full feature will be sold or released upon each of his release days.

NIRUPAM CHANDRA GUHA.

THE PLACE OF CINEMATOGRAPH IN EDUCATION

THE Indian Universities were not at the outset founded to impart education as we generally understand the term—viz., a harmonious development of the physical, intellectual and moral faculties combined with some practical training or technical knowledge, to fit the recipient of education for public and individual duties in life or a station in life which suits his aptitudes and interests. The only object of the university is to test proficiency.

Teaching in Indian Schools and Colleges implies coaching for examinations. In some it consists of only giving notes. While the evils of an examining English University are fully existing in Indian Universities, they are without the redeeming features or compensating influences that can be found in England. However defective the School, College, or University education of an English boy may be, the defect is made good by home influences and association. Send an Englishman to any part of the world, he will as a rule rise to the occasion and meet the situation, for his instincts and early practical education fit him for emergencies in life. The influences which educate a man at home, in the streets, and in the gatherings, either for games, sports or lectures, are very few in India.

There are lots of things one never learns at school. Education and knowledge do not necessarily mean the same thing. It might be very useful, for instance, to know that the sun is precisely so many millions of miles from the earth but it is more of an education to get an insight into the manners and customs of a foreign people, to follow the destinies of human beings, and to know life. The photo-play is going to do for the crowd what Ibsen and Bernard Shaw have done for the intellectuals. Those responsible for the education of the young in this country have not yet attempted to give the cinematograph its true place in the school where it may aid the teacher in imparting lessons in geography, natural history and other kindred subjects. But in the Western countries the turning has been reached in the long lane leading to the regular adop-

tion of the cinematograph as an educational instrument. A very interesting experiment in educational cinematography is in progress at a theatre at Balham. Seven secondary schools of the district have united for the purpose of giving the pupils one morning each week a cinema demonstration bearing upon the school lessons of the preceding week. The classes from the different schools go direct from the schools to the cinematograph theatre instead of having the usual geography, science, or Nature study lesson in the classroom and return again to the school after they have witnessed the particular films arranged for them.

At the Carnegie Institute of Technology, Pittsburg, the steel business is being taught by means of a series of films entitled "From Iron Ore to Finished Steel." The pictures show the ore mine "Hull-Rust," in the Mesaba District of Minnesota, the largest ore mine in the world; the digging of ore by gigantic steam shovels, and loading on peat freighters, and again, the unloading. The product is then followed to the United States Steel Corporation Mills, when every process of steel-making is most vividly portrayed. The films are described as being of exceptional educational value, as, besides showing steel-making, they also show the various processes of the by-products, coke-plants, and many other accessories.

Views of foreign countries and life add a living interest to the dull geography lesson. Films showing the process of manufacture of articles handled or seen by children every day and almost indispensable to modern civilisation, or films upon natural history and country life for town-bred children, or views of great ships sailing out of port for children bred remote from the seas—all these have their value. Again, the cinema has the power to gain the interest of the young in simple and instructive scientific experiments.

There is not the slightest doubt that plenty of room exists for films upon new educational subjects or upon the same subjects from different points of view. The cinematograph is an educational instru-

ment as valuable to the teacher as the telephone is to the business man.

In this connection it is interesting to note the activity of the London Teachers' Association. This society, mainly consisting of London teachers of all grades, has been investigating the question of films and has appointed a sub-committee to draw up a report and recommendation upon existing films, and offer suggestions for new films suitable for elementary schools.

The picture-play has great possibilities as a form of dramatic expression. Certain novels and plays lend themselves admirably to pictorial treatment. The growing im-

portance of film work on the literary side is proved when we see that everything distinguished in English literature is represented in cinematograph. A few hours in a cinema theatre which selects its subjects carefully can supply interest for king, peasant, queen and seamstress.

The cinema has won for itself a place of honour in the world's activities as a power for the entertainment and instruction of the masses. But what we do further hope is that it should become a great force in the educational system with enormous possibilities for the coming generations.

X.

REVIEWS

Mr. Gangoly on the South Indian Bronzes.

By S. KUMAR, M.R.A.S.

South Indian Bronzes. A historical survey of South Indian Sculpture with iconographical notes based on original sources. By O. C. Gangoly. With an introductory note by J. G. Woodroffe. Published by the Indian Society of Oriental Art, Calcutta, 1915. 40. pp. i-xiii, 1-80; pl. I-XCV.

In the life-history of a nation, art is the greatest factor. It is art which marks out the standard of human civilization and it is art again which definitely points out the particular niche of culture in which any nation is to be placed; it is in fact the primary factor in the evolution of a nation's life and it may be said, with considerable emphasis, that art and life of a nation are interdependent on one another. The one moulds the other in as much as it is moulded by the other.

The work under review is a treatise on art. About the usefulness of the treatise and the qualifications of the author, who is an artist himself, there can be no gainsaying. The "project of the present publication" came to the mind of the author "during a hasty pilgrimage to the shrines" of South India and the discovery of the texts of the Silpa-Sastras contributed no less to the materials which he had been collecting during his travels for a treatise on the bronzes of South India.

In the preface the author takes his readers into confidence and speaks about his inability in obtaining "first-hand informations" for his want of knowledge in the Tamil language. These informations mainly relative to the history of the subject are not, in our humble judgment, to be regarded as of supreme importance in such a work as under review. It is art in all its technicalities and classical exposition that we expect from an artist of the author's calibre; and our

expectation, we are sure, has been adequately fulfilled.

The work is prefaced by an introduction from the pen of the Hon'ble Justice Sir John G. Woodroffe. We fully concur with what has been said in the very sympathetic and appreciative foreword; the work is likely to contribute a good deal to the dispelling of misconceptions of foreign critics and to refute unjust criticisms of prejudiced art connoisseurs. The so-called monstrosities of the Hindu Pauranic conceptions had been much decried by some self-styled art-critics of the West. The merits of Brahmanic sculpture have failed to appeal to some of the artists and connoisseurs of Europe and America and are still looked down upon as "a freak of Asiatic barbarism," not because there is anything which is monstrously absurd and devoid of æsthetic conceptions in the specimens hitherto collected, examined and studied, but because, above all, they are exclusively Indian. Preconceived notions and personal equation have much to answer for such deprecatory remarks from quarters wherefrom better and more appreciative criticisms would be expected. The case in point reminds us of the remarks from the pen of such a scholar as Dr. L. D. Barnett of the British Museum, in connection with the work under review, in the pages of the *Journal of the Royal Asiatic Society*.* Dr. Barnett in his notice is not at all forgetful of the fact that the author is a Bengali; the admission of the author of his ignorance of Tamil has afforded him grounds enough to run him down. I wonder how much of Tamil Dr. Barnett knows himself! And to that single theme two full pages have been devoted.

"Tantaene animis coelestibus irae!"

Dr. Barnett should have had the good sense to discover that the work in question is neither a work on iconography, nor a historical treatise on the bronze art of South India, but that it is a work on the technics of the classical art of the South. Dr.

* Jan., 1916, p. 174

Barnett is misled by the subtitle which we think is a misnomer. The fault partly lies with the author.

The work opens with a discourse on the distinction between the Dravidian and the Brahmanic feature of civilization and a traditional account of the advent of the so-called Aryan culture into the South. We cannot and do not agree in all that has been said here. A curious medley has been made of myths, traditions and legends, of history and quasi-history, of facts unwarranted and unwarrantable, followed by a sketchy cultural history of South India. Thus the author could have spared himself the pains to put in without doing any very great injury to his work. Kasyapa, Agastya and Rama we can very well afford to banish to the realms of myth and folklore. The only matter of importance with regard to our old friend Agastya is that the Silpasastra is said to be his work; but this is only a tradition, and as such should have been left out of consideration as of no historical value. Dr. Barnett in his notice has alluded to this portion of the work and taken the author to task for his having set store by these traditions. But he is mysteriously reticent about the subject-matter proper of the work. There is, however, one thing that we should not lose sight of. These myths and traditions reflect, though very vaguely, the culture of the nation during a very extensive period. The spirit in which Dr. Barnett has wielded his trenchant pen against the work and its author, for the simple reason that the author happens to belong to a race which fails to commend itself to his good graces, is neither broad nor scholarly.

Mr. Gangoly, in the middle of the first chapter, gives an elaborate account of the manuscripts he had discovered and which afforded him materials to work with. Some of these works are attributed to their traditional author Agastya; but traditions like this and the colophons of manuscripts bearing out such myths and traditions should have no place in critical and historical studies. The author could have heightened the value of the historical and critical portion of his work by being a little more incredulous of traditional accounts of the introducer of so-called Aryan craft amongst the Dravidians. Agastya and his followers must be consigned to the dreamland of myths and folklore peopled by the shadows woven into being by the gossamer threads of imagination.

The second chapter introduces us to Saivism and the growth of the Sivite art in South India. The author holds that the exact time at which the doctrine was established in India as a definite cult is not at present ascertainable; but the creed is as old as the Vedas. The *Rudras* of the *Rig-Veda* were the gods of the howling storm. In some of the hymns, probably the earlier ones, the singular form, viz., *Rudra*, is to be found. *Rudra* is represented as the father of the *Maruts*. The Vedic pantheon perhaps at a later period felt the necessity of multiplying some of its divinities and probably *Rudra* shared in this multiplication. The conception of *Rudra* had certainly not much to do with the phallic Siva; neither are we ready to accept that the Sivite of the South took the idea up from the Vedas. The compromise between the two conceptions and the identification of the altogether different divinities are the results of that spirit of toleration which is found in India alone. To anyone who has made a serious study of the history of Indian religions and who has had the opportunity of devoting himself to the study of the cultural history of the so-called Aryans, as it is presented in the Vedas, we are sure, he will be convinced that in the present case

two separate conceptions, which were originally foreign to one another, were made to coincide at a comparatively later age and give birth to the phallic Sivitism. This amalgamation was certainly gradual and set afoot long before the *Mricchakatika* was written. What we contend is that it is doubtful whether the Phallic Sivitism was an exotic creed planted in the Dravidian land, or that it was an indigenous conception of the South which was afterwards elevated and rendered more dignified by grafting on it the superior spiritual and mythical conception of the North.

The remarks of Patanjali, viz., *Mouryair hiranyar-thibhir arcah Prakalpita*, referred to by the author, does not prove anything with regard to either the Sivite icons, or the introduction of the Sivite cult among the Southerners. The author then proceeds, in the rest of the chapter, to narrate in brief the history of the Sivite faith among the Tamil-speaking Dravidians.

The foregoing chapters form a sort of preliminary note to the main subject-matter treated in the work. The real treatise commences from the third chapter of the book. There would have been no discount on the value of the work if the two preceding chapters were never written. The chapter opens with a lucid exposition of the canons of the Silpasastras and in connection with this the various stages in the process of casting metal images have been illustrated and explained. Then follows the enumeration of preliminaries such as, preparation of wax models, taking of measurement, judging of dimensions and poses, etc. For the preparation of models the Silpasastras afford us formulæ which a novice has to learn by heart. These canons form the most important portion of the Sastras. They inculcate rules of proportion which once played not a very inconsiderable part in the development of the arts of sculpture and metal work in India. Certainly, they do limit the scope and the originality of the artist's genius and at times the representations become rather more conventional than suggestive. It is also true that they do not leave a very great latitude for the artist. But such limitations have often been necessary. And we cannot endorse in full all that the author wants to tell us in the following passage:—

"The rules and canons are only limitations for the mediocre and the incapacitated—and not the real artist, to whom the fixed convention of a particular theme is never a barrier to his artistic expression." (p. 31).

Generally and broadly speaking Mr. Gangoly is perhaps right; but by testing the statement in a closer light we must have to confess that the general statement quoted above is rather too vague and sanguine. Certain canons there are and will always be, which even a Raphael or a Guido have to abide by. Executions of Rodin or the paintings of Alma Tadema would fail to appeal to our senses and feelings if they did not conform to the elementary conventions of art. Of course, the Dhyanamantras are rather too rigid, but still the art which flourished in Northern India, under the regime of *Mahayanaism*, has not failed to supply us with specimens of exquisite beauty and finish. The Dhyanamantras of the Buddhists cannot be called less conventional and rigid than those of the Sivites. The Greeks had their canons and the Romans had theirs too; and judging from the specimens hitherto discovered and studied, none of the classical types have been found to strike up a very distinct note of revolt against their respective canons.

The author has very lucidly explained the subtle distinction between the *dhyanas* and the *lakṣanas*.^{*} The three 'poses' and the 'fingerplays' have been amply illustrated by means of figures, diagrams and drawings. The author's experience has also been noted, and we learn with regret how the art is dwindling away and how the craftsmen little care to know what has been enjoined by their predecessors whose works have become almost classical to the students of South Indian art. The author says "the modern practising sculptors however have generally forgotten the practice of these three poses and although I read to many of them the original text from Kasyapiya and Agastya giving the exact plumb lines with reference to the three *vaṅgas* [*sic*, for *bhūṅgas*] they were unable to illustrate the rules by a diagram" (p. 40). This plain statement of truth leads us to realise how gradual and how complete is the downfall of the Indian craft. The indolence and the mechanical and easy mode of living characteristic of inhabitants of the tropical East have much to do to bring about a sleepy indifference to what is little out of the way of their merry go-along life.

In chapter IV the relation between the Chola art and that of the earlier Sivite schools has been traced. Special studies of the evolution of certain images, as for instance that of Natarāja, have been given. A comparative study of the contemporary stone sculpture has been pronounced to be necessary, as the one and the same artist would sometimes cast the bronze images, and at others chisel the stone panels in the niches of temples. An account of the Sivite art as it flourished under the Pallavas (*sic*, for Pahlavas) has also been subjoined.

One thing that strikes us as out of place and far from the mark is the account of the Indian immigration in the East Indies. What we expect here to find is the oldest example of the images in South India; the authors' researches should have been circumscribed by the sea-bound coast lines of India. The Javanese art and the art of the ancient Indian colonies are manifold enough, in all their different stages of evolution, to be dealt with in volumes, each of which would be at least as big as the work under review.

A brief history of the bronze art of the South which follows will, no doubt, prove interesting to the students of the Indian artistic evolution. One regrets its being so short and the presentation of data so meagre. In one point we cannot but differ from what the author has said about the attribution of certain images "to the great sculptors of historical fame," Jaya, Parojaya and Bijaya [*sic*, for Vijaya]. These three names, I am sure, the author has found in Taranatha's history.† We do not think the author has any inscription to stand by. A particular image or any group of images can never be regarded as a specimen or specimens of artistic creation of any particular person or of persons, when there is nothing in the shape of inscription indicating the name or names of the artist or artists, or any other similar tangible and contemporary evidence. Assertions such as the one above, unsupported by evidence of tangible and contemporary nature, cannot be introduced into the sacred arena of history. Mere stylistic grouping of images can never help one to

trace the development of an art with definiteness and accuracy.

The author has also attempted to trace the relation between the Ceylonese and the South Indian art. On this point, we think, it is better to keep the question open. The study of the style and the history of the Ceylonese art has only begun. We are not yet sufficiently advanced to pronounce any definite opinion on the art of Ceylon. The conjecture which the author has ventured is rather too vague, and hence, unacceptable.

In the last chapter the author winds up his magnificent work with a comparative study of the art of various nations and sects. We fully agree with the author in what he says with regard to the Buddhistic art. About the effect of the canons, the author here only elucidates his own assertion in one of the preceding chapters, with regard to which we have only to refer to our remarks already made. The comparison between the Greek, the Egyptian, the Roman and the Indian artistic evolution as instituted by the author has not much to commend itself to our serious attention. Patriotism is good, no doubt, but there are times when proper moderation is to be exercised, and in no case it should be allowed to render one's reasoning cloudy. The classical, the Egyptian and the Indian art had each their excellence, their special features and characteristic ideals. One conception is as good as the other, so long as it is clearly and aesthetically expressed in the artist's execution. The physical idealism of the Hellenic art, the gross reality of the Romans, the remote and uncommunicative figures in the Egyptian monuments, the super-sensuous and mysterious conception of the Indian artists are all superbly magnificent and exquisitely beautiful. It would be martistic to judge one as superior to the other, and the judgment would depend much upon the individual liking and predisposition.

Lastly, we think we should be lacking in our duty, should we not point out to the author the unworkable nature of his system of transliteration. The system sanctioned by the Geneva Congress of the Orientalists is the best suited to the purpose of romanising Oriental languages and should have been adopted by the author.

In fine, we have only to say that in spite of difference of opinion on certain points which we have tried to argue in the course of our review, we have not the least hesitation to say that the work is a very valuable one and sure to prove useful to the students of Indian art. We tender our heartiest welcome to the work and our sincerest good wishes to the author and request him to have his treatise translated and published in Bengali, so that, the literature of his own province may boast of one more jewel added to her crown.

Rawlinson's Shivaji.

Shivaji the Maratha, his Life and Times, by H. G. Rawlinson. Pp. 125, 2 illustrations, and 1 Map. (Clarendon Press, 1915), 2-6 net.

This is the first life of Shivaji in English, apart from the translations of one or two old chronicles which have appeared before. During the last 30 years, a mass of historical materials has been collected and made available by the industry of a band of scholars in India, especially in the Deccan. The vernacular sources are all in print and most of them have been subjected to criticism and sifting in the pages of the Marathi magazines. The Persian sources have been mapped out and partly given

* Perhaps owing to the loose system of transliteration the word is spelled *lakṣanas* in the text.

† This is another instance of loose transliteration.

‡ *Gesch. d. Buddh. i. Ind.* Ueberset. v. A. Schiffner.

in translations in this Review from its very foundation in January 1907. The time has, therefore, come for a scientific study of these materials and the production of a trustworthy, minutely accurate, and documented life of Shivaji. Such a task has been attempted with an eminent degree of success by Mr. Govind Sakharām Sardesai, B.A., in his *Marathi Riyasat*, Vol. I, published last winter in the vernacular.

Professor Rawlinson, on the other hand, seems to have undertaken the book under review in a dilettante and uncritical spirit. He has totally ignored the "other side," namely, the mass of Persian materials translated in this Review; and with regard to the Marathi *bakhar* he has made the strange selection of later and legendary works in preference to earlier and more reliable ones. The Marathi lives of Shivaji, arranged in order of time are:—

1. *Sabhasad bakhar*, written in 1694 by Shivaji's secretary Krishnaji Anant, (tr. by Mankar).

2. *Shiva-dig-vijaya*, composed in 1718 and ascribed to Khandō Ballal, the son of Shivaji's chitnis Balaji Avji, ed. by Nandurbar-Kar and Dandekar. (Baroda, 1895.)

3. *Chitrāgupta bakhar*, c. 1765.

4. The Raigarh Life, incorrectly translated by Frisset in Forrest's Selections, c. 1780.

5. *Chitnis bakhar*, written in 1810 and ed. by Kirtane.

As to the relative merits of these works, Mr. Sardesai writes: "Chitnis's *bakhar* is certainly inferior to Sabhasad's and to *Shiva-dig-vijaya*. The latter quotes original documents extensively and I am sure the author had full access to Shivaji's *dattar*. The *Chitrāgupta bakhar* is only an enlarged copy of Sabhasad with a mixture of self-composed Marathi verses here and there. The author, Raghunath Yadav, calls himself Chitrāgupta in order to show himself off as a Puranic. He had a fund of information from various sources, but no idea of accuracy or historical truth." (See also Rajawade, Vol. iv. 7-17). As for Chitnis's *bakhar*, Grant Duff writes (i. 120n): "Mulhrām Rao's life of Sivajee is very voluminous; but I do not think that he has made a good use of the valuable letters and records in his possession."

And yet Mr. Rawlinson has thought fit to rely on the most discredited of the above five sources, and "chiefly used the Chitnis *bakhar* and the *bakhar* known as Chitrāgupta's in the compilation of the present monograph"! Sabhasad's *bakhar* is referred to in three places only and *Shiva-dig-vijaya* is totally ignored by him.

It is clear that Mr. Rawlinson has not himself read any of the Maratha books he refers to in his Introduction. On page 7 he speaks of the Chitnis *bakhar* as edited by Mr. Sane,—while as a matter of fact Mr. Kirtane edited Chitnis's life of Shivaji and Mr. Sane edited the same author's lives of Shambhuji and Rajaram.

A still more glaring error disfigures his citation of English authorities. He repeatedly speaks of Briggs, *Ferishta* (1832) as one of "the English works on Maratha history," in entire oblivion of the fact that Ferishta never wrote a word about Shivaji or Shahji, for the excellent reason that his work was completed about 1600 A. D. What Mr. Rawlinson really means is Jonathan Scott's "History of the Deccan, miscalled Scott's *Ferishta*," (printed at Shrewsbury, 1794), which contains a long account of Shivaji and his descendants, translated from the Persian *Dilkasha* and there entitled "The Journal of a Boondelah officer.

Turning to the book itself, we meet with serious mistakes on almost every page. A few are noted below:

P. 18, l. 26. *Hala* the Andhra King has been confounded with *Harsha*, the Emperor of N. India. P. 21, bottom, Mr. Rawlinson repeats the myth that the Bahmani dynasty was named after the former Brahman master of its founder. Evidently he has never heard of Major Worsley Haig's refutation of this story in the "Journal of the Asiatic Society of Bengal" and his "Historical Landmarks of the Deccan." P. 33, bottom, Mulla Ahmad is represented as going to the court of Shah Jahan. Khafi Khan is, no doubt, responsible for the error; the correct name, which is supplied by the Bijapur official history, *Basatin-i-salatin* being "Adil Shah" and not "Shah Jahan." When Mulla Ahmad did desert to the Mughals (1665), not Shah Jahan but Aurangzib was on the throne. P. 37, Shivaji's officers never captured Mulla Ahmad himself, but only his daughter in law. Pp. 39-41, the correct dates of Shahji's arrest and release by the Bijapuris and the falsehood of the charge of "cowardly betrayal" brought against Bajji Ghorpade in this connection, have been established by me in this Review, (July 1916, pp. 9-10.)

P. 45, Aurangzib became viceroy of the Deccan for a second time in 1653 and not in 1650. P. 46, l. 9, *Kalyan* should be *Kaliyani*; Bijapur fort was not really threatened by Aurangzib in 1657. P. 47, the Bijapur official history represents Alzal Khan's army as 10,000 troopers and not 5,700 men. P. 57, note, the ballads are right in calling the Brahman envoy Krishnaji Bhaskar, as all the Maratha records give him that name, while Gopnath is the mistake of Grant Duff. P. 54, Mr. Rawlinson seems to have changed his opinion about Shivaji's innocence in the Alzal Khan affair, since writing his "Indian Historical Studies." There is no valid reason for holding that Dr. Fryer (who arrived at Bombay in Dec. 1673) "got his information from some one present on the spot," at Pratapggarh in 1659. The wild gossip of the bazar and the camp was more likely to reach the ears of the English doctor at far off Surat.

P. 62, l. 11. Siddi Jauhar had rebelled against Bijapur much earlier (about 1659) and he died of disease, as the *Basatin-i-Salatin* records (pp. 353-364 of Ms.), P. 67 l. 7, Shaista Khan opened his campaign against Shiva in 1660 and not in 1663 (*vide* official history of Aurangzib's reign.) P. 72, an authentic account of Jai Singh's campaign against Shivaji, based on his despatches has been published in this Review July, 1907. P. 72, l. 22, "Shivaji determined to go to Delhi to interview the Emperor." This is incorrect, as the interview took place at Agra. This fact has been established from contemporary records in this Review (Aug. 1907, p. 153) and is also mentioned in Irvine's *Travels of Manucci*. Mr. Rawlinson is pleased to add the note, "this point is much disputed." No scholar who cares for accuracy any longer disputes it. P. 80, bottom, it was not a "marvel" that the ex-king of Kashghar should have had a golden bed, seeing that he had received 11 lakhs of Rupees from the hospitable Aurangzib. P. 81, Ali Adil Shah II. died on 24 Nov. 1672 (old style) and not on 15 December. P. 88, l. 6, Jai Singh's campaign against Shiva occupied only 3 months in 1665 and not three years, 1662-5.

The strong point of the book is its attention to topography and the bearing of geography on strategy. Chapter VIII., which reviews the character and achievements of Shiva, is an excellent sketch in 12 pages. As for the style, it is as impossible for Pro-

fessor Rawlinson to write a dull page as it, evidently, is for him to use scholarly accuracy or critical discrimination in dealing with an Indian subject.

Kipling no doubt sings of

"A land east of Suez,

Where there aint no ten commandments ;"

but that is no reason why Mr. Rawlinson should jettison the laws of historic evidence in the case of a hero living "east of Suez."

JADUNATH SARKAR.

HIGHER COMMERCIAL EDUCATION IN THE UNIVERSITY

IT was claimed at one time that the introduction of English education in India meant the death-knell of what Macaulay called "Absurd History and absurd Metaphysics" and the opening out to the Hindu the rich treasures of English literature and learning. Whatever truth there may have been in these claims in the infancy of University education in India, we no longer regard the sole aim of University education to be the unfolding of western literature and learning before the speculative and philosophic intelligence of the east. We have learnt to look to the Universities not merely to enable our youths to comprehend the writings and ideas of European scholars and authors, but to understand and get a grip of the world in which they are born and in which they have to live. Higher education of any other kind does not deserve that name, it does not stimulate thinking and impart the quality of forming sound judgment, and in short, if it does not equip a man to go out into the world and to meet it with rectitude and strength and with a certain measure of success. University education in India has undoubtedly produced individuals who have in their own person realised these expectations preeminently, but taking the bulk it will be hardly a matter of dispute that these expectations from higher education in India have been very imperfectly realised. Not only, that, but shrewd observers may discern a progressive deterioration, which must be stayed by robust and unflinching measures, if we are not to lose entirely even the small and partial benefits that we realise from higher education in these days.

The thing is writ large on the very surface of the economic and social life of

this country so that he who runs may read. But testimony to bear out the above, if needed, is to be had in abundance. Only the other day, Sir George Barnes, Member for Commerce and Industry, said :

"I have always already felt the great necessity which exists, not only on economic grounds, but for reasons which touch closely on problems of national character and development, of securing for the people of the country a greater share in the exploitation of her natural resources and of adding to the limited and somewhat unsatisfactory avenues of employment for your young men a greater share in those afforded by commerce and industry. At present the educated young men of this country seem to seek employment almost exclusively in Government service, at the Bar, or Journalism, and these three channels of employment do not give sufficient scope for the young men of this country. I should like to see a large part of the stream turned in the direction of commerce and industry."

Similar views mainly with reference to the need for active scientific research were expressed almost at the same time by Sir Thomas Holland, Chairman of the Industrial Commission at Madras. These ideas were corroborated in the opening speech of His Excellency the Viceroy before the Legislative Council at Simla. His words were:

"I should like to impress this further fact on Indian parents. When they are planning the future of their sons they might well pause to consider whether instead of sending them to join the overstocked market of the legal and literary profession, it would not be better to turn their attention to the possibilities of employment in scientific agriculture. As the department expands, it will afford greater opportunities of advancement, and the man who elects this science may do well for himself and at the same time contribute to the prosperity of his country."

Whether the alternative suggested be commercial and industrial pursuits or close scientific research or probing into the possibilities of scientific agriculture, a note of disappointment with the present activities

in our University runs through all these. If the education at present imparted does not fit the young people out for anything but literary and legal careers, which have on all admissions become forbidding, something must be substituted. If there is such a great gulf between what is wanted in life and what is taught in our educational institutions, if the present day education does not bring—economically—harmony with the surroundings, and therefore a certain measure of success in them, it should be supplemented or supplanted by something that may set a man out with a more cheerful outlook, with better understanding of things and men he is going to meet in life. It follows that the education which we are imparting must be based on utilitarian grounds and if that is so, the reproach must be bravely faced and we should proceed to do something that will be more practical than the scheme devised by the early pioneers of education. We have had enough of the morbid self-glorification of seeking knowledge for its own sake and we as a poor country can no longer afford to offer our young men the literary oddities of the 17th century English authors or the varied fare given by English poets or items of that kind. The first important breach in the old system will have been made by the introduction of higher commercial education and it is perhaps just as well that instead of adopting a policy of violent reversal of the old educational order, we should attempt a new experiment on the small scale involved in the introduction of commercial education at the various seats of learning in India.

The unsatisfactory result from the education in vogue is not, however, the only ground for advocating Higher Commercial Education at our Universities. Even if we had an ideal system of education, the proposal for Commercial Education would still have to be considered on weighty economic grounds of its own. It is not perhaps generally realised that the consequences of so little part of the trade of India being in the hands of Indians themselves are very serious, resulting in a drain year by year which exceeds several times the much advertised "political drain" from this country. The reactions on the life of the people from extensive investments of foreign capital in India, from the so-called

development of the country, are also very imperfectly appreciated by the leaders of social thought. The growing problem of population with the concurrence of frequent famines and distress should also make us pause and think whether we can go on depending for ever on the bounty of nature in agriculture alone, even if it could be transformed by modern science. And if one considers how little of our much-vaunted agricultural prosperity due to the rise of our staple produce actually puts into the pockets of the people of this country, the urgency of taking a larger share of the vast trade of India in our hands would seem to be very great. The call for business ability also emerges from the ruins of many a concern which the new born spirit of Swadeshi enterprise brought into being, but which in most cases were sadly bungled by men endowed with more enthusiasm than the commonsense of business. And it is humiliating to remark that while the whole world has been fighting and covering itself with glory or riches, how little we in India have been able to make of the commercial and industrial opportunity offered by this war. The reason for this is not far to seek. The consumer of articles is not only at our door, but he is knocking insistently to be provided with things. In this country endowed with the greatest variety of soils and climatic conditions, there is not, nor will there ever be a dearth of raw materials of any kind that may be required. Besides, the accumulated wealth of this country, exaggerated perhaps by those, who from the West are casting a wistful glance towards it, is only partially and very imperfectly utilised in the economic activities of this nation. What was then wanting to enable us, if not to share a fraction of the vast wealth piled up by economically neutral nations like Japan and America during this war, at least to ward off the dumping invasions of Japan and to minister to our own needs. It was nothing but lack of initiative and business enterprise. Lest any one should be inclined to put this down as a permanent characteristic of the indolent East, let us hasten to assure them that all enterprise proceeds from knowledge and that the training and information which enable people of other countries to leave us behind in the race for business enterprise are not matters disposed of by Divine Providence,

but could be compassed by intelligent organisation and human efforts of our own.

In these days when economic ramifications are so wide-spread and so complex, the prosperity of a non-trading and purely agricultural community is rendered very risky indeed. We have perhaps still to realise the lesson involved in the presence of the Japanese cotton buyer buying for his principal on the spot in districts in the interior and away from the Port of Bombay. Nor do the people of Bengal seem to have grasped the full significance of the ousting of the indigenous Bengalee agency, which used at one time to collect jute from the districts and to bring it down to Calcutta and to bale it and even to ship it abroad. The want of trading instincts may still cost Bengal very dear. In the meanwhile the Marwari who has replaced the Bengalee seems himself to be doomed because of his extreme backwardness and extremely conservative ways of doing business. Capable in normal times, he is taken by storm, when faced by a new situation and the special proclivity to panic shown by the Marwari community at the outset of the war was only an unhealthy symptom of the same fact. Endowed by nature and assisted by business tradition and environment in his early life, even a Marwari, who is a great asset of this country in spite of all that can be said against him, cannot raise great hopes in the minds of those who look a generation or two ahead, unless he alters his ways. Modern business involving powerful rivalry must be done by modern methods. And to do this even the Marwari, the much abused aristocrat of the business world, must avail himself of every new agency of improvement that we can devise. Higher commercial education at the Universities is one of them.

In measuring the progress of a community, the condition of one class must be considered by itself over a period of time. And the class that has preeminently a claim for our serious consideration is the middle class. They produce the true national type and they preserve and extend the culture of the race. Even in communities that had politically a more undisturbed and prosperous history, the middle class provided leaders of thought and activity. In India in all departments of life we have, since the beginning of the

British rule, drawn almost too exclusively on the middle class for men to lead us. The economic condition of this class in India presents facts that ought to cause considerable anxiety. The middle class did not come unscathed for the economic policy of the East India Company, from the early blunders regarding land revenue policy or from the severe action of the Industrial Revolution through which the country is passing. As a result there is evident among them even in normal times economic distress of an acute character. The prices of things have been going up and appearances have to be maintained. The avenues for employment are severely limited. The budgets of many middle class families in large towns would reveal the distressing fact of habitual malnutrition predisposing to many wasting diseases. The unemployment among socially respectable classes—known as the Bhadralog in Bengal—is appalling. It is most noticeable in Bengal where there is no relief in small trades and business such as is found in other parts of the country. These are the classes that have availed themselves most of University education. They are now finding out that the sum spent on the education of their children does not even return reasonable interest in the earnings which the young men receive. These in the case of a graduate are often lower than what a good mason or a carpenter gets. If the direct and indirect evil consequences of this state of affairs were known more widely than they are, remedies for it would have been devised long ago. It would not be difficult to trace the connection of this economic fact about the life of the middle class in India, with the special problems in reference to young men which have arisen in Bengal or with the general feeling of melancholy dissatisfaction which is to be noticed elsewhere. If the lot of the educated middle classes is to be improved, they should be made to look beyond government service and the legal profession to commercial and business activity. And as a contributory to this end, commercial education should be established at the Universities.

The idea that the University should attempt to teach Commerce has been pooh-poohed. No University can guarantee to turn out a full-fledged businessman. All that can be done and is to be attempted is

that every item of study should be selected and taught in such a manner as to make the recipient possess the maximum amount of information likely to prove of use to him, so that by theoretical knowledge supplemented by the illustrations placed before him or observed by him, he may be enabled to acquire the quality of distinguishing in business what is sound from what is hollow, and of forming judgment generally with regard to business matters. What he would get in this way would be adaptability and the quality of making the most of the opportunities offered by his environment in whatever position he may be placed. It is not intended that University Education would supplant the recognised road to business success, viz., apprenticeship. Apprenticeship must remain, but the period of apprenticeship, the great trials and disappointments of apprenticeship, these would be very largely altered and instead of a man working by rule of thumb, the training at the University would produce a businessman with imagination and insight, knowing things in the world as they are and therefore enterprising.

Great men of business have no doubt been produced through the old system. But to argue on that account that systematized knowledge is of no value and to disparage the attempt to impart it in a readily accessible manner to a large number must be characterised as an unworthy attitude of mind in those incapable or unwilling to understand human progress. The old world with its many difficulties produced remarkable travellers but it has not been seriously suggested that for this reason means of communication should not be developed and when the progressively deteriorating material condition of a community requires urgent measures, we cannot afford the academic solace of showing our Jamshedji Tata or Rajendra Mookerjee produced without any careful collective forethought or plan. Let us remember that regular cultivation is more to be relied upon than collecting stray fruits however sweet the latter might be on some occasions. And the safest rule for the people of India to follow in this connection is what the wise man laid down: "What you want to see in the life of the people, put that first in their Schools."

It has been established that modern

business is a science by itself and is capable of being studied scientifically. There are people who believe that there is great cultural value in the study of modern commerce almost equal to the cultural advantage from the study of modern history or modern philosophy. And for Indian Universities to launch on this field will not be in any sense a leap in the dark. Advanced countries whose progress in other directions have been by no means contemptible have till now profited largely by the careful teaching of commerce at their Universities. America, Germany and Japan have been Pioneers of deliberate and well-planned commercial education in their seats of learning; and even in England, remarkable for great conservatism in many departments of life commercial education enjoys a growing popularity. The Universities in these countries have regarded commercial education as a legitimate field for their activity. They have placed it side by side with education in other branches of knowledge in an honourable position without suffering in their dignity or their usefulness.

Many reasons are assigned for the backwardness of this country. During Christmas a dozen platforms will ring with suggestions of all kinds. Official communiques, long departmental resolutions and occasional pronouncements from the highest officials inform us from time to time about the shortcomings of our economic life. If there was deep conviction behind the remedies suggested by popular and official oracles, we should expect them accompanied by some action. The question of putting our house in order in the way of reorganisation of the whole economic life of this country is a larger problem, but while we can, we might lay a few stones at the foundation. One of these rough and unattractive but very solid stones is the installation of Commercial Education at our Universities. The need for this is for reasons noted above very great indeed. Even in their character as consumers the whole community have an interest in low prices for the various commodities of commerce. So long as there is dearth of business ability, so long as only a few enterprising castes from the west of India engage in commerce and so long as the large bulk of it is handled by agencies which are not Indian at all, the community is robbed

in the way of enhanced prices from a million little openings. As one of the poorest people in the world, we should expend the money and the energy at our command with the greatest circumspection and even if we are to continue to waste in other directions, we should have at least those items in our system of education which we can well afford and which will not only repay what is spent on them but many hundred times over.

It is gratifying to find that a beginning in this direction has already been made in India and the University of Bombay has been working a scheme of commercial education for the last 3 years. The Universities of Madras and Calcutta are already feeling the first touch of those forces which are going ultimately to transform the educational system in this country and in response to it are proposing the establishment of Faculties of Commerce. What measure of popular

and official support their efforts will have, remains still to be seen. If our Universities are going to be centres of life and not merely centres for the study of dead knowledge, if they are going to be contributaries to the life of the nation that is to come in future, if the education imparted at our Universities is to enable our youths to face the world with greater strength and greater knowledge of the problems which life has in store for them, then they must read correctly the economic needs of the moment and must attempt to bring the system of education in harmony with those needs. And above all considerations, however mundane and uninteresting it may be, stands the problems of bread and butter, a dreadful reality for everybody in this poor country.

M. SUBEDAR.

University of Calcutta,
12th September, 1916.

GLEANINGS

Moving Pictures.

The moving picture is of British origin.

The so called 'wheel of life,' a mechanical device, represented the movement of a galloping horse as early as 1833. The machine is described as one consisting of a hollow cylinder turning on a vertical axis and having its surface pierced with a number of slots. Around the interior was arranged a series of pictures representing parts of the figure intended to be seen in motion, and when the cylinder was rotated the observer, looking through the slots, experienced the illusion of seeing the object in motion.

Fifty-two years later Mr. Friese-Greene was engaged in his experiments. These were of quite a different character from the 'wheel of life' figures, for his pictures were projected on a screen.

The cinematograph was made possible, in 1890, by the invention of the celluloid roll film.

The whole universe, or as much of it as he can reach, is enlisted by the latter-day "movie" director as his ally, for no part of the world is free from his invasion if he sets out to find the necessary and proper background for his story. When a town does not exist he builds it for himself.

War-pictures, are faked. Clever mechanical devices, the unstinted use of electricity, spring bayonets, gun-powder-bladders, and underground explosives are used in the production of these war-pictures, which are so realistic that they seem to bear the earmarks of the French and Belgian trench and the Polish battle-field.

"Agricultural laborers, farmer's sons, and village

youths, drest in the uniforms of the British and German armies, are drilled in their new duties and initiated into the mysteries of disappearing bayonets, exploding fake shells, trench-warfare, and make-believe 'gassing.' Stroll along a quiet, country foot-path bordering some rolling grassland sloping to the sea and you may come upon a horde of yelling men whose spiked helmets and wicked-looking bayonets glint in the sunshine as they charge toward you. If you take cover nimbly and watch, you will see they are rushing a trench filled with khaki-clad British soldiers. You shudder involuntarily as you see those glinting bayonets sinking into human flesh three or four inches, but you find later that the points are protected with little felt buttons and that they are attached to the barrel end of the rifle by a spring that allows them to retract several inches upon striking a solid substance.

"As the soldiers ford a stream in their mad charge, columns of water splash high into the air. After awhile you realise that these columns are caused by dropping shells from concealed artillery. You wonder how it is that all these country 'supers' are not maimed or even killed until you find out that the water-columns are caused by electrically exploded bladders filled with gunpowder and hidden beneath the surface of the stream. As the charging 'Germans' reach the opposite bank and make straight for the 'British' machine guns, terrible explosions occur. They are the shells still 'dropping' from the British artillery. The explosions are electrically controlled by a stage-director or producer, and are caused by

burying small cans of gunpowder here and there under the ground to be rushed. At the proper moment the fake mines are exploded by throwing a witch or pressing a button, thus sending clods of earth, a cloud of smoke, and a dummy figure or two into the air. All the vivid effects of a big shell bursting on the ground are thus obtained.

"To give to the moving picture patron an idea of the vast numbers of troops now in France, the producers used an ingenious leather-band machine, which, in conjunction with a broad window built into the scenery-wall, is all that is necessary. The spectators in the theater see women at the window waving out to the departing troops. The tops of rifles with bayonets fixt move past the window and bob up and down in a never-ending stream. Beneath the window, concealed from the spectators, an operator turns a leather band passing over two fly-wheels about twelve feet apart. Attached to the top of the band are rows of bayonets. As the handle is turned the bayonets move along with the realism of a marching regiment, rifles on shoulders, fastened, as they are, to the leather band, which can be moved at any speed.

"In 'close-up' pictures of big explosions, such as bridges, forts, and the like, it is not politic for the movie men to get too close; a chance projectile may come their way. To overcome this difficulty the camera is set up in some adjacent spot and focused upon the scene of the explosion. From a safe distance the operator controls his camera by electrical wires, the result being as satisfactory as if he had been on the brink of the scene himself.

"So excellent are the pictures of modern 'warfare' thus obtained by producers in rural Britain that the motion-picture-theater patrons cannot realize that the motion-picture men are not allowed near the firing-line in the theaters of war and that the restrictions imposed on the producers prevent them from obtaining the real thing in France."

No less a psychologist than Prof. Hugo Munsterberg, of Harvard, tell us in an article entitled "Why We Go to the Movies," contributed to *The Cosmopolitan* (New York, December), that the moving-picture play of the future is to be a popular study in psychology. It is to specialize in emotion, feeling, imagination. It is to carry to perfection the sort of thing whose rude beginnings we witness on the screen when the great financier, sitting dreamily before his study-fire, sees in memory his past life in a mining-camp; or when the villain's hand is stayed by the fantom of his murdered wife, rising to confront him. He reminds us that if the "movie" is to develop into a new form of artistic expression, it must specialize, not in the things that can be done better, or even as well on the stage, but in things that may be seen on the screen while the "legitimate" drama is unable to show them at all. Foremost among these are psychological effects, and this is why he believes that in the field of the mind lies the future domain of the moving-picture play. Already it is tending in this direction.

Liquid Fire as a Weapon.

A contributor to *The Scientific American Supplement* describes the flame-throwing device as follows:

"Among the many scientific tools of destruction employed in the war, the so-called *Flammenwerfer* of the Germans—a more or less hose-like apparatus for hurling jets of flaming liquid—holds an important place, as much by virtue of the moral effect produced as by any material damage achieved, even tho the latter may be considerable. This idea of projecting

upon the adverse trenches and their occupants a rain of liquid fire was no sudden after-thought of the German mind. It was conceived, studied, and perfected for several years before the war.

"In the earliest models, the combustible liquid was propelled by a gas-condenser out of a portable or fixt reservoir, and was lighted by some automatic device as it escaped from the nozzle of the projecting instrument. Subsequent improvements have been made with the sole object of overcoming certain disadvantages inherent in this model.

"With the instrument described, the flaming jet can make its effects felt at a distance of forty or forty-five yards, but is not capable of exceeding that range effectively, because of the consumption of the liquid in transit. Further, with the main jet thus in ignition at the mouth of the apparatus, enough heat is given off to embarrass seriously the operator.

"These facts made clear the desirability of a method of ignition whereby the inflammable fluid would not begin to burn until it had almost, or quite, reached its objective. Not only would useless consumption of the fuel be thus avoided, but the effective range would be increased, and the effects of the instrument, at a given range, greatly heightened

PORTABLE APPARATUS FOR PROJECTING FLAMES.

A, carbonic acid; G, gas; P, gasoline; R, valve; I, igniter for lighting the inflammable liquid; J, flame.

"To meet these demands, a double-barreled liquid-gun was devised, having the upper barrel much smaller than the lower, and pivoted so as to turn independently. The fluid is shot from the two barrels simultaneously, but only that from the upper one ignites automatically. This small, burning stream is so directed that it unites with the larger, non-burning one at any desired point, and then, of course, ignites the large jet. The small stream is then shut off, the large one continuing to flow. The flames do not spread backward along the jet toward the nozzle, but are carried forward to the target, and, striking the ground, form a veritable sheet of fire, which continues to ignite the fluid as fast and as long as it falls.

"Only at this one point is the large jet in contact

with the flame. All combustion, therefore, takes place at the spot where it will do the most good—or harm; and at that point a very severe conflagration takes place, much more severe than is possible when the combustible fluid wastes its substance upon the air between gun and target. It is especially to be noted that flexibility of fire is not sacrificed. By gradual change in the trajectory, the objective can be shifted without interrupting the continuity of the ignition; so that the field may be developed in any direction desired, and a rain of fire of any sort whatever produced. Further, instead of allowing the liquid to burst into flame at the moment of impact, it is often advantageous to let it flow for some time 'cold,' until the entire objective region is saturated, then, turning on the kindling jet, to produce a holocaust throughout that region.

"The method of expulsion of the jet from the apparatus, as well as means of combustion, has been greatly improved. In the earliest *Flammenwerfers* devised by the Germans, the inflammable liquid was driven from its reservoir by pressure of carbonic acid or other gas. But, on account of the extraordinary powers of absorption manifested toward all gases by the hydrocarbons best adapted for use as the basis of liquid fire, the best part of the explosive gases was merely dissolved in the liquid. Not only did this cause a direct and serious diminution in pressure, but it led to mixing of liquid and gas; so that as the fluid issued from the nozzle it no longer exhibited the uniform and compact structure necessary for accurate aiming and efficient combustion, but was composed of a frothy, bubbling mixture of liquid and gas which, putting forth but feeble opposition to the atmospheric resistance, had its range materially shortened. All these difficulties are obviated by the substitution of a mechanical pump, or, if safety or convenience demand that the reservoir shall be at a considerable distance from the firing-line, several pumps in series as motive power in the expulsion of the liquid from the gun.

"The liquids most commonly employed in these *Flammenwerfers* are the low coal-tar oils resulting from the distillation of tar at a pressure of six atmospheres or more. The particular compound most used by the Germans is a mixture of gasoline and pitch. Under combustion this gives off a thick, grayish smoke, which not merely obscures the vision of those under fire, but has an intolerable odor."

Testing the Criminal's Mind.

Says a contributor to *The Journal of Heredity* (Washington, June):

"There are still plenty of people to be found who think that, given a proper chance, every child will turn out well. If the child grows up to become a pickpocket, or sets fire to an orphan asylum, it is assumed that society has sinned against him, at some time or other, by depriving him of the proper environment. We are at least expected to accept the idea that criminals are men and women who have deliberately or unknowingly broken some man-made law, and who, if given a stiff enough jolt in the way of a fine or imprisonment, will be brought to their senses and led to see that it pays better to walk within the limits of the statutes therein made and provided.

"Such a view, more or less modified, still influences a large part of law-making and the execution of laws. That view is based principally on metaphysical doc-

trines and theories of 'natural rights' and the equality of man.

"The way of modern science is to test these time-hallowed theories by exact observation, by classifying and measuring the facts. Criminology has undergone a good deal of this process, and the first results were a wide swing of the pendulum in the other direction. Lombroso and others put forward the idea of the 'born criminal,' the man who was predestined to become a murderer, or a forger, or whatever the signs might indicate. This extreme view is now largely discredited, but students of the subject nevertheless generally recognize nowadays that many per-

THE HEALEY PICTURE PUZZLE

The person examined must put in the board squares which will make the people pictured do suitable things, and thus, prove that he is able to observe and reason intelligently. Two boys in the middle of the picture, for instance, are evidently picking a football, and the square bearing a picture of a football should be put in the opening. If the person tested puts in a picture of a cart-wheel, or a pair of shears, it shows a lack of sense. Of course, the interpretation of the evidence furnished by such tests as this depends upon the previous experience of the individual examined.

sons are born with some inherent defect, which makes it impossible for them to be law-abiding citizens.

There is only one police department in the United States which maintains a laboratory for the examination of adult offenders, and that is New York, where since January, a well-equipped psychopathic department has been in operation.

"For measuring the mentality of the people who come to it, the psychopathic department uses thirty or more tests, picking out in each instance the ones which seem best adapted to the case. The tests are, for the most part, well known to those whose busi-

ness it is to handle such instruments. Simple questions are asked, and the subject's reasoning power and other abilities tested, not only by his answer, but by the time it takes him to evolve it.

"One of the tests used is the Trabue Language Scale D, which is given below. The subject is asked to write one appropriate word in each blank, and is given seven minutes for the task :

4. We are going.....school.
76. I.....to school each day.
11. The.....plays.....her dolls all day.
21. The rude child does not.....many friends.
63. Hard.....makes.....tired.
27. It is good to hear.....voice.....friend.
71. The happiest and.....contented man is the one.....lives a busy and useful.....
42. The best advice.....usually.....obtainedone's parents.
51.things are.....satisfying to any ordinary.....than congenial friends.
84.a rule one.....association.....friends.

"It does not follow that a person is abnormal simply because he fails on this or any other single test. It is highly essential that all tests be interpreted, and, naturally, such evaluation should be made only by persons having a wide experience in these matters.

"The 'Opposites' test is one which is being widely recognized as very useful. The patient is given a list of words such as

good	outside	quick
tall	big	loud
white	light	happy
false	like	rich
sick	glad	thin
empty	war	friend

"He must write down as rapidly as possible the words which mean the exact opposite of each of these. A normal person can write them almost as rapidly as his hand can move the pencil; but a feeble-minded individual, even tho he has spent a number of years in school, becomes bewildered at such a task.

"In examining the higher levels of intelligence the manner in which the individual reacts to complicated directions is frequently suggestive.

"The useful 'form boards'.....are much employed; they require the person examined to fit blocks into their proper places in a frame. Some people insist on putting round pegs into square holes, and that in itself is significant....."

"Writing with the aid of a mirror gives an idea of the subject's ability to learn, and of his motor control. Memory, concentration, and other easily tested abilities are also observed."

Crime, says Dr. Bisch, the director of the laboratory, should never be considered apart from mentality. In addition to evidence of guilt, the New York Police Department now also furnishes certain facts regarding the mental responsibility of the offender. This is logical and is another proof of the practical value of psychology. If a man is feeble-minded at his fifth conviction, he was just as feeble-minded at his first conviction; it will pay the community, therefore, to examine, segregate, and properly treat prisoners before arraigning them, instead of waiting until they reach the court or penitentiary. The psychopathic laboratory is regarded by Dr. Bisch as a huge sieve, for the selective classification and disposition of the criminal population. It is not a sentimental undertaking—it is scientific, wise, and humane.

A "Thinking-Machine"

Says a writer in the "Export American Industries" (New York):

"In the future, authors of moving-picture scenarios, stories, and plays may use their thumbs and fingers instead of their brains. The idea is the thing in story and play-writing, and the more novel the idea, the greater the success.

"With this thought in mind, a clever young man has invented what he calls a 'Thinking-Machine.' It took a smart Yankee boy to realise the wildest dreams of inventors except that dream of accomplishing perpetual motion.

"The thinking-machine is simplicity itself. Mr. Blanchard decided that there are never more than six situations to be comprehended in a well-rounded story or play. All the thoughts and actions, he says, can be reduced to a simple formula of words, and these words are mechanically drawn from his machine and arranged by it.

"The device is a pasteboard box, 3 by 6 inches and 2 inches deep, containing six printed paper rolls, each wound on a pair of spindles. The ends of the spindles extend through the box and are turned by hand. In the upper part of the box, above each paper roll, is a slot, in which appears one word after another as the roll is turned. On the six rolls are printed, respective-

IT THINKS OUT A PLOT FOR THE WRITER.

The machine invented by Mr. Blanchard which mechanically creates the skeleton of a story or motion-picture scenario.

ly, six remarkably grouped classifications of words. The rolls are arranged in such a manner that, as they are turned a story is unfolded and recorded on the face of the box. There are 1,200 different words used, and the inventor says, considering the surprising number of synonyms in our language, these are sufficient to describe any action necessary.

"The effects wrought by a manipulation of this machine are truly wonderful. For instance, suppose you were a story- or scenario-writer and you got up this morning with a vacant head, but you had to 'put across' a story a day and you did not know what to write about. The little thinking-machine is brought from its closet and set up before you. You start to turn the top spindle and you come to the word

'BEAUTIFUL.'

"That's a good place to stop in, in the early morning under such circumstances. Then you give spindle No. 2 a few twists, and you come to the word

'CANDIDATE.'

"Now this makes sense, and starts the imagination. In these feminist days, you conjure up all sorts of thoughts about a beautiful candidate. It is now time to twist spindle No. 3, and presently there flash the words

'APPEALS TO,'

and you accept the situation because it is so perfectly natural for a beautiful candidate to be appealing.

"Turning spindle No. 4 through a maze of words, you will ultimately come to the line

'THE PEOPLE.'

"Your beautiful candidate is now appealing to the voters. You can't stop there, and you go on with spindle No. 5. Supposing you permit the spindle to stop at the word

'ADMIRATION.'

"It would be a very delicate and delightful situation for your beautiful candidate to be admired by the people to whom she is appealing, and if you will continue to turn the spindle No. 6 to its logical stopping-point, you will find there the happy climax word,

'ELECTION.'

"Here, then, is the idea for a scenario or story, fit for the embellishing pen of any fiction-writer. The idea is complete, and all that the tired author needs to do to win his daily stipend is fill in the gaps with descriptive words."

"In testing the machine, the inventor turned out the following story-skeletons in less time than the average author would take on a park bench in observation of the throng to dredge up from his mental depths an idea for one magazine yarn.

"Impudent—Player—Taunts—Umpire—Brawl—Expulsion.

"Literary—Adviser—Borrows—From—Author—Explanation—Restoration.

"Brilliant—Atheist—Corrupts—Clergyman—Change—Outcast.

"Parvenu—Backwoodsman—Disowns—Chum—Feud—Poisoned.

"Frisky—Bachelor—Compromises—Housemaid—Chivalry—Betrothal.

"Gullible—Banker—Consults—Humorist—Prank—Bankruptcy.

"Fibulous—Janitor—Encounters—Ghost—Hysteria—Vow.

"Reformed—Burglar—Visits—Banker—Envy—Poverty.

"Repulsive—Jarate—Wrongs—Cannibal—Retaliation—Feast.

"Cynical—Foster-parent—Sells—Foundling—Conscience—Atonement.

"Enterprising—Publisher—Buys—Plagiariist—Cooperation—Profit.

"Indulgent—Warden—Entertains—Prisoner—Opportunity—Escape.

"Beautiful—Widow—Marries—President—Inspiration—Election.

"There is undeniably a great, wide field of opportunity, says the inventor, to reap a rich harvest for earnest endeavors on those who carry originality and individuality.

Mr. Arthur Blanchard whose device was adopted by the Harvard University for teaching story writing.

"The device has brevity and wit, telling the story with but six words. The inventor is the organizer of the play-writing course at Harvard University, where students are now thumbing spindles and fiction by the bushel. But the public will never dream that these works of art were born in the brain of a pasteboard box."

Gunpowder as a Chimney-sweep.

Mr. S. R. Russell in an article entitled "Shooting Soot from Stacks," contributed to *The Du Pont Magazine* (Wilmington, Del.) tells us that in many industrial plants large smoke-stacks or

kiln-stacks frequently become clogged, and must be freed from soot in order to maintain draft. He advocates "shooting them up" in order to attain this result, and the method, tho' violent, would appear to be effective and harmless. Writes Mr. Russell:

"A simple, economical, and most efficient method to accomplish this is to shoot the stack with the 'Stack gun' and blasting-powder. This gun can be used in cleaning either lined or unlined stacks

THE STACK GUN.

Three or four shots from this gun will clean the soot out of a large factory-chimney, unless it is uncommonly dirty

brick or steel, without any fear of injury to the stack or lining

"The gun can be made out of an old piece of shafting about 4 inches in diameter and 14 inches to 16 inches long. Bore a hole $1\frac{3}{4}$ inches in diameter and 10 inches long in the center of the piece. Then bore a small horizontal hole $\frac{1}{4}$ inch in diameter through the piece to the bottom of the center-bore. This hole serves as a touch-hole for inserting the fuse.

"The whole thing can be mounted on a pedestal about 6 inches in diameter so that it will stand in an upright position.

"The method of operation is as follows: Pour some FFF blasting-powder into the mouth of the cannon to about 2 inches from the top. Tamp to the collar with dry clay. A short piece of fuse is inserted in the touch-hole and in contact with the main powder-charge. Open the flue-door at the bottom of the stack, set the cannon on the bottom and in the center of the stack, light the fuse, and close the flue-door.

"The explosion shakes and loosens the soot adhering to the sides, causing it to fall to the bottom. It can then be removed through the flue opening.

"A charge of 8 inches of FFF powder, $1\frac{3}{4}$ inches in diameter, is sufficient for a stack up to 100 feet high and 4 feet in diameter, or over. The number of shots necessary to clean a stack thoroughly depends upon its condition. Ordinarily, three or four shots will clean a stack, but if very dirty it may require more. The size of the charge and length of the cannon can be regulated to suit the height and diameter of the stack.

"There is no doubt about the efficiency of this 'gun' for cleaning smoke-stacks. One of the largest manufacturing concerns in the country has used this method for several years, without an accident or injury in any way to the stacks."

FORMS AND TYPES OF STATES IN ANCIENT INDIA

BY NARENDRA NATH LAW, M. A., B.L., PREMCHAND ROYCHAND SCHOLAR.

II

THE *Aitareya-Brahmana* uses a series of terms some of which signify overlordship, and some other distinction in the form of government. At times a few of these may be used as mere complimentary epithets, but not always. They are *Rājya*, *Sāmrājya*, *Bhāujya*, *Svārājya*, *Vairājya*, and *Pārameshthya*¹. *Adhipatyā*² (lit., supreme power), *Jānarājya*,³

Svāvasya,⁴ and *Ātishtha* are also found.

quoting 'Vajasaneyi-Samhita, X, 9, 'Kāthaka-Samhita,' XV, 7 and 'Maitrayani-Samhita II, 6, 9

4 'Aitareya-Brahmana,' VIII, 6. It means, according to Sāyana, 'aparatantra' i. e. lit., 'absence of dependence on others.'

Mr. K. P. Jayaswal (in the 'Modern Review, 1913, p. 538) derives the name Surat (the modern town of Western India) from Svarat (republic), which he says the 'Vrishni-Sangha' was, in that part of the country. But I think it is a mere phonetic resemblance, the word having real affinity with 'Surashtra', the ancient name of the place, of which the present Surat was a town (or perhaps the capital). It is a well known fact that a town or a capital very often takes its name after the country in which it is located.

1 'Aitareya-Brahmana,' VIII, 1: 4, 5. Cf. 'Sankhayana-Srauta-Sutra' XVII, 16, 3.

2 'Panchaviṃśa-Brahmana,' XV, 3, 35; 'Chhāndogya-Upanishad,' V, 2, 6.

3 See Weber's 'Über den Rājasuya,' p. 31, f. n. 5

5 See 'infra.'

The explanation of the words given by Sāyana¹, the commentator, in connexion with a certain passage in the *Āitareya-Brahmana*, is based more or less upon their literal meanings, and partake, to some extent, of a spiritual character akin to that of Śrīdharaśvāmin's comment on a similar passage in the *Bhāgavata-Purāṇa*². A subsequent passage of the aforesaid *Brahmana*³ and Sāyana's comments thereon, give us more secular details. Indra, it is stated, was installed in the east by the

divine Vasus for *sāmraja*. Hence the several kings of the east are consecrated after the divine practice, and the people call them *Samrāt*. Next, He was consecrated in the south by the divine Rudras to *bhauja*, for which the sovereigns of the *Satvants* in the south are consecrated after the divine practice and receive the title *Bhoja*. The divine Adityas installed Him in the west to ensure His *Svārāja*. Hence the sovereigns of the *Nichyas* and *Apchyas* in the west are similarly installed and denominated *Svarāt*. Afterwards, the Visvedevāh consecrated Him in the north to *vairāja*. That is why the sovereigns of the countries Uttara Kuru and Uttara Madra in the north, beyond the Himalāyas, are similarly consecrated and termed *virāt*. Next, the divine *Sādhyas* and *Apchyas* anointed Him for *raja* in the central region, for which the kings of that region i.e. of Kuru and Pāṇchāla as well as of *Vasa* and *Uśinara* are similarly anointed and called *Rājā*⁴.

Some of the terms seen in the light of the later historical discoveries have been explained by Messrs Macdonell and Keith. *Svarāj*⁵ (lit. self-ruler) probably stands "for the republican form of Government of which traces are found in the Buddhist literature by Mr. Rhys Davids in his *Buddhist India* (p. 19)." *Vairāja* (lit. absence of kings) also points perhaps to autonomous people like the *Irāshtrakas* (the kingless) signifying, as noticed before, the self-ruled communities.

THE GRADATION ACCORDING TO THE SUKRA-NITI.

In later times, both the terms *svarāt* and *virāt* are found to be used as signifying monarchies of a particular grade determined by their incomes. *The *Sukra-Niti* gives the

1. Next follows Indra's consecration in the upper regions to the other worldly positions called 'parameshthya,' 'maharaja,' 'ādhipatya,' 'svavasya,' 'ātishtha'. See Weber's 'Über den Rājasūya,' pp. 115, 116. Messrs. Macdonell and Keith look upon the above epithets of sovereigns of the several regions as embodying probably a sound tradition. 'V. I.' II, 433.

2. 'Rig-Veda,' I, 39, 7; 51, 15; 61, 9 &c., (of gods). 'Atharva-Veda,' XVII, 1, 22; 'Taittiriya-Saṁhita' II, 3, 6, 2; IV, 4, 81 &c.

3. 'V. I., II, 494.

4. 'Sukra-Niti' (Jivānanda's ed.) ch. I, slks. 184—187. Such classification of monarchs is also found in other late works, like the 'Varadātāntra' (2nd patala, quoted in the 'Sadbakalpadruma') where a *rāja* is said to have an income of 100 lacs, 'samrāt,' 10 lacs, and a 'mahasamrat,' 100 lacs.

1. 'Āitareya-Brahmana' with Sāyana's commentary (Bibl. Indica) vol. IV, p. 188. "Here 'raja' 'desādhipatyam' (rule over a country); 'Sāmrajyam' 'dharma-pālana' (righteous government); 'bhaujyam' 'bhoga samiddhi' (increase of enjoyment); 'svarajyam' 'apratadhinatvam' (absence of dependence on others); 'vairajyam' 'itacchhyo bhupatibhyo vaisishtyam' (enjoyment of more distinguished qualities than those possessed by other kings)." [See Weber's 'Über den Rājasūya,' pp. 111, 112; Goldstucker's 'Sanskrit-English Dictionary' under 'rahishtakā'; Haug's translation of the 'Āitareya-Brahmana'; Mitra's 'Indo-Aryans,' II, 47, and Colebrooke's 'Miscellaneous Essays,' I, 39 ff.] These terms, the commentary says, relate to this world while the following to the other world: 'parameshthiyam' 'prapat lokapāṭh' i. e. (attainment of the world of Prapāt), 'rajyam' (obtaining dominion there), 'maharajyam' (mighty rule), 'svavasyam' (independence) and 'ātishthatvam' (long residence) these three also taking place in the other world. The 'Gopatha-Brahmana' [pt. I, v, para 8, pp. 77, 78 (Bibl. Indica)] says about Prapāt that he became 'Rājā' by 'Rājasūya,' 'Samrāt' by 'Vajapeya,' 'Svarāt' by 'Asvamedha,' 'Virāt' by 'Puruṣamedha' and 'Svarāt' by 'Sarvamedha.'

2. Śrīdharaśvāmin's comment on 'Skand' to ch. 83, slk. 41 attaches spiritual significance to many of the terms, as will be apparent from the following. — 'Sāmrajyam' 'sārvabhaumam padam' (position of an overlord); 'svarajyam' position of Indra; 'bhaujyam' enjoyment of the previous two positions; 'virāt' possession of qualities such as 'anant' (i. e. the power of becoming as small as an atom) etc., 'parameshthiyam' position of Brahman; and so forth.

3. He further states that the four terms 'sāmraja,' 'bhauja,' 'svārāja' and 'vairāja' follow the order in which the four cardinal points are mentioned in the 'Vahvricha-brahmana,' viz. east, south, west and north, and are applied to the presiding deities thereof,—Indra, Yama, Varuna and Kuvera. (For the order of the directions, of 'Amarakosha'—"Indra vanhiḥ pūṣi-pati nāritto varuno matut, Kuvera isapatayo purvādinaṁ disām kramat.") Indra is also mentioned as 'samrāt' and Varuna as 'Svarāt' in the 'Rig-Veda' (see VII, 82, 2). It is difficult to state whether the titles used in connection with the gods were subsequently applied to the sovereigns in the respective directions, or vice versa.

4. The 'Āitareya-Brahmana' (Bibl. Indica) with Sāyana's comments, Vol. IV, pp. 230 ff. Weber 'Über den Rājasūya,' pp. 115, and f. n. 2.

following ascending order of the monarchs based on their incomes in silver *karshas* :—

<i>Silver-Karshas</i>			
<i>Sāmanta</i>	having	1 to	3 lacs
<i>Māṇḍalika</i>	"	4 "	10 "
<i>Rājā</i>	"	11 "	20 "
<i>Mahārāja</i>	"	21 "	50 "
<i>Svarāt</i>	"	51 "	100 "
<i>Samrāt</i>	"	1 "	10 crores
<i>Virāt</i>	"	11 "	50 "
<i>Sārvabhauma</i>	"	51	crores or upwards.

THE AMARAKOŚHA.

The *Amarakośha*¹ gives three significations of *Samrāt*: (1) the performer of the *rājasuya*, (2) the monarch exercising his control over a mandala ("circuit") consisting of twelve kings, and (3) the monarch who can have his mandates obeyed by the kings under his supremacy.

EPITHETS FOR PARAMOUNT SOVEREIGNTY.

We meet with other epithets such as *chakravartin*, *paramesvara*, *paramabhattāraka*, *maharajādhiraj*, *sarvabhūma*, *akhandabhumipā*, *rajaraj*, *visvaraj*, *chaturantesa*, &c.² Monier Williams explains *chakravartin* as a "ruler, the wheels (*chakras*) of whose chariot roll everywhere without obstruction, emperor; sovereign of the world; ruler of a *chakra* i.e. country extending from sea to sea"³. It is also explained another way: "a discus (*chakra*), the sign of the god Vishnu

(Lakṣādhipatyam rājyam syat,
Sāmrajyam dasalakṣake,
Satalakṣe, mahesari,
Mahāsamrajyam uchyate).

¹ Yenashtam rājasūyena mandalasyesvaraschayah, Sāsti yaschājūrya rājnah samādāttha rājakam.

See 'Amarakośha' under 'Samrāt.'

The 'Saddakalpavidhana' says in connexion with the above passage that a *Samrāt* is (I) a monarch who has performed the *rājasuya*; or (II) the ruler supreme over a 'mandala' of twelve kings; or (III) the sovereign who can command the kings under his supremacy as his officials. It also adds "as the opinion of others" who take it as (IV) a ruler whose sway extends over the earth from sea to sea.

² In the Buddhist literature, *chakkavatti* is sometimes used in the sense of a universal monarch. See Childer's 'Pali Dictionary' quoting, 'Abhidhānapadipikā,' 335 and Turnour's 'Mithras' 27. There are three sorts of 'chakkavatti' viz. 'chakkavāba-chakkavatti', 'Dipachakkavatti' and 'padesachakkavatti', the first ruling over the four great continents, the second over one only, and the third over a portion of one.

³ Monier Williams' 'Sanskrit-English Dictionary.'

is to be found among the marks on the hands of all *chakravartins*; and such a ruler is one whose prowess cannot be withstood even by the gods"⁴. Some of the other epithets such as *Paramabhattāraka*⁵, *Paramesvara*,⁶ *Mahārājādhiraj* are found in close connexion with one another in the inscriptions, and very elastic in their application⁴, the other titles in the above list being but synonyms of these. A distinction is however observed between the use of this set of titles with another comprising such terms as *Mahārāja*, *Bhattāraka*, &c., found in use with the names of tributary kings⁵.

The Supreme rulers enumerated in the *Āitareya-Brahmana*⁶ are :—

NAMES OF PARAMOUNT SOVEREIGNS IN THE ĀITAREYA BRAHMANA

<i>Supreme Ruler</i>	<i>Lineage</i>	<i>Consecrating Priest</i>
Janamejaya	son of Parikshit	Tura, son of Kavasha
Saryata	of the race of Manu	Chyavana, son of Bhṛigu

¹ H. H. Wilson's Translation of the 'Vishnu-Purāṇa' (Bl. I, ch. XIII, verse 46) Vol. I, p. 183 and n. Dr. Fleet adds ('Corpus Inscriptionum Indicarum,' Vol. III, p. 183 f. n. 4) that the word 'chakravartin' denotes a universal ruler and is one of the technical terms of "paramount sovereignty" though it is not so frequently used in the inscriptions as the others are. The expression "paramount sovereign" is used by him in the sense of "a sovereign supreme in his own dominion but not necessarily reigning over the whole of India" (Ibid.; Index p. 332), from which it seems that it signifies nothing more than an independent sovereign as opposed to one whose control over his dominion is under a limitation, e. g., a feudatory king. Hence all the titles found in the 'Corpus' and described as implying paramount sovereignty may apply to any independent ruler ranging from a sovereign of the position of Samudra Gupta whose power and territory were imperial to one of a much lower rank, e.g., Sarvavarman, the Maukhari (Fleet, 'op. cit.' p. 221) who is called Mahārājādhirāja.

² I.e. "most worshipful one."

³ I.e. 'Supreme lord.'

⁴ See fn. in connexion with 'Chakravartin.'

⁵ See Fleet, 'op. cit.'

Like the above titles we meet with others applied to the wives of the sovereigns, and indicative of the ranks they enjoyed by virtue of those of their husbands, e.g., 'Paramabhattārikā', 'Paramadevi' 'Bhattārikā' &c. 'Mahādevi' applies to the wife of a 'Mahārājādhiraj' as in the case of Kumaradevi (Fleet, op. cit., p. 221), but the simple Devi serves the same purpose at a later period (Ibid., p. 232).

⁶ 'Āitareya-Brahmana,' viii, 21—23 where the great unction ('mahabhisheka') is mentioned. Cf. Weber, 'Erisches, myedischen Ritual,' 8; 'Über den Rajasuya,' pp. 117, 118, f. n. n. and Colebrook, 'Miscellaneous Essays,' I. 39—43.

Sātānika	son of Satrajita	Somasushman, grand son of Vajaratna
Ambāshthya		Parvata and Nirada
Yudhamisra	grandson of Ugrasena	Parvata and Narada
ushti		
Visvakarman	son of Bhuvana	Kasyapa
Sudāsa	son of Pijavana	Vasishtha
Marutta	son of Avikshit	Sāhvarta, son of Anguasa
Anga	son of Virochana	Udaṁvā, son of Atri
Bharata	son of Duhshanta	Dirghatamas, son of Mamata
Durmukha, king of Panchala		Brihaduktha
Atvarāti	son of Jananapati	son of Satyahavya sprung from the race of Vasishtha

THE SIGNIFICANCE OF THE RAJASUYA

It is stated in the *Āitareya-Brahmana* that all the kings in the above list "subdued the earth" by virtue of the *rajasuya* (royal sacrifice) which they had performed. The performance of this sacrifice cannot however be always taken as a mark of paramount sovereignty; for it was a ceremony for the inauguration of a king and "a state ceremonial to which any petty ruler might fairly think himself entitled."¹ Dr. Mitra however states, "from its very nature, a ceremony like the *rajasuya* could not be common anywhere or at any time, much less during the Hindu period when India was never held by a single monarch" basing his statement upon a passage from the *Taittiriya-Brahmana*—"r jā Svārājyavāno r jasyena yajeta" which he interprets as "none but a king who wishes to be a universal monarch exercising supremacy over a large number of princes can perform the sacrifice"². These differences may perhaps be reconciled by keeping in view that in later times the sacrifice lost its simplicity and changed into a complex state function performable by suzerains³.

The ceremony of the conquest of the four quarters forming part of the *rajasuya* was for

conferring upon the king a prospective blessing, and did not imply at least in the earlier periods a condition precedent to the ceremonial⁴.

THE Vajapeya.

The *Vajapeya*, a Soma sacrifice, was at one time of lesser importance than the *rajasuya* followed in the case of a king by the latter sacrifice, and in the case of a Brāhmana by the *Brihaspatisava* (i.e. festival for his appointment as a royal *purohita*)⁵.

But the *Satapatha-Brāhmana*⁶ exalts the *Vajapeya* over the *rajasuya* maintaining that the latter confers on the sacrificer mere royal dignity, while the former overlordship.

THE Asvamedha.

The performance of the *asvamedha* (or horse-sacrifice) involved "an assertion of power and a display of political authority such as only a monarch of undisputed supremacy could have ventured upon without humiliation"⁷. In its earliest phase, however, it was very simple. The horse was let loose after some preliminary rituals to wander for some time, and, on return, was anointed and slaughtered⁸. Its complex formalities in its fully developed form were later accretions.

Prof. Eggeling remarks that as a rule the

1. For the deviations of the '*rajasuya*' in the epic and 'paurāṇika' periods from the Vedic type in regard to rituals, see Goldstucker's 'Sanskrit-English Dictionary' under 'Abhisheka.'

There is a sacrifice named 'Prithi-Sava' celebrated for the attainment of supremacy. It comprehends some of the rituals of the '*rajasuya*' but lasts only about a day. [*Taittiriya-Brahmana*, Kāṇḍa 2, prapathaka 7, Anuvaka 5 (vol. II, Bibl. Indica, pp. 315, 316 and 361, 362).]

2. V. I., II, 256. See also Eggeling (S.B.E.) Vol. XLI pp. xxiv, xxv, quoting '*Taittiriya-Samhitā*, V, 6, 2, 1; '*Taittiriya-Brahmana*, II, 7, 6, 1; '*Lātyāyana-Srauta-Sūtra*, viii, 11, 1 and '*Asvārāyana-Srauta-Sūtra*, ix, 9, 19.

3. V. I., I, 1, ff.; 2, 1, 10; Cf. *Kātyāyana-Srauta-Sūtra*, XV, 1, 1-2 Weber, 'Über den Vajapeya,' interprets the situation differently from Eggeling; V. I., II, 256 and Eggeling (S. B. E.) vol. XLI, p. XXIV.

4. Eggeling (S. B. E.) vol. XLIV, Introduction, p. XV.

Cf. '*Taittiriya-Brahmana*, III, 8, 9, 4;

'*Apastamba-Srauta-Sūtra*, XX, 1, 1.

— "A king ruling the whole land ('*sarvabhauma*') may perform the '*asvamedha*'; also one not ruling the whole land."

5. See Eggeling 'op. cit.' and V. S. Dalal's 'History of India,' pp. 132, 133.

1. See Eggeling (S.B.E.), vol. XLIV, Introduction, p. XV.

2. See R. L. Mitra's 'Indo-Aryans' vol. II, pp. 2, 5, cf. 'J. A. O. S.', xiii, pp. 145, 146 (Hopkins). Dr. Mitra states that the rituals of the '*Āitareya-Brahmana*' recommends three kinds of bathing; 1st called 'Abhisheka' for kings, and 2nd 'Punarabhisheka' for superior kings, and 3rd 'Mahabhisheka' for emperors. Indo-Aryans, Vol. II, pp. 46, 47.

3. Cf. V. S. Dalal's 'History of India' vol. I, pp. 131, 133.

closely watched animal would not probably range very far from the place where sacrifice would be performed, and though the officers in charge were not allowed at any time to force it to retrace its steps, they could have had little difficulty in keeping it within a certain range of grazing. Not to take up the challenge implied in the progress of the horse was regarded as a mark of cowardice. In any case, a strong ruler who had already made his power felt among his neighbours would run little risk of having his horse kidnapped even if it had strayed beyond his dominions, while a weak prince might find it very difficult to keep it secure even within his own territory. ¹²

THE LIST OF NAMES OF ASVAMEDHA SACRIFICERS
IN THE SATAPATHA-BRAHMANA.

The list of performers of the horse-sacrifice given by the *Satapatha Brahmana* ¹ contains the following names:

1. Janamejaya Pārikshita having as his priest Indrota Daivāpa Saunaka ;
2. Bhīmasena
3. Ugrasena
4. Srutasena
5. Para Atnāta, the Kausalya king ;
6. Purukutsa, the Aikshvāku king ;
7. Marutta Avikshita, the Āyogava king ;
8. Kraivya, the Pāṇchāla king ;
9. Dhvasan Daitavana, the king of the Matsyas ;
10. Bharata Dauhshanti ;
11. Rishabha Yājñatura ;
12. Sātrāsāha, the Pāṇchāla king ;
13. Sātānika Sātrājita. ²

NAMES OF PARAMOUNT SOVEREIGNS IN THE
PURANAS.

I next proceed to enumerate from the *Purānas* and other Sanskrit works a few names associated either with extensive conquests or with the performance of sacrifices indicative of supreme political position.

We find Prithu in the *Agni-Purāna*, ⁴

as also in the *Bhāgavata*, ¹ *Brahma*, ² *Brahma-mānda*, ³ and *Siva* ; ⁴ Sagara in the *Vāyu*, ⁵ *Vishnu*. ⁶

Bhāgavata, ⁷ *Brahma* ⁸ and *Padma* ; ⁹ Marutta in the *Markandeya* ¹⁰ and *Padma* ; ¹¹ Bharata, son of Dushmanta, in the *Vāyu*, ¹² *Vishnu*, ¹³ *Brahma*, ¹⁴ and *Agni* ¹⁵ ; Dushmanta

Mullah kakutssthaschānena yuvanāsvo jayadrathah,
Mandhata muchukuntischā panta tvancha pururavah.

'Ibid.' ch. 219, slk. 51.

These two couplets contain the following names :
Prithu, Dilpa, Bharata, Dushmanta, Satrujit, Vah, Malla, Kakutsstha, Anena, Yuvanāsvo, Jayadratha, Mandhata, Muchukunda and Pururava. These names form part of the 'Mantras' recited at the coronation described in the 'Agni-Purāna.' The names are evidently those of renowned emperors invoked to bless the king who is being inaugurated.

1. Bhagavata-Purāna, Skanda 4, ch. 21, slks. 9 and 10.

2. Brahma-Purāna, ch. 2, slk. 24.

3. Brahmānda-Purāna, ch. 69, slk. 3.

4. Chakravartu mahāvryah prithu rajādhipo' bhavat. Siva-Purāna (Dharma-samhitā), Ch. 24, slk. 65.

See also 'Ibid', slk. 66.

5. Sa dharmavijaya raja vijitvemam vasundhānam,
Asvam vichārayāmāsa vajmedhāya dīkshitah.

Vāyu Purāna, ch. 88, slk. 144.

6. Akhilabhumandalapatnattvinyaparakramo
'nekayajnakouda-ratipaksha-kshayakanta
tavodare 'chakravartu' tisthati.

Vishnu-Purāna Pt. IV, ch. 3.

7. Saha tenaiva sanjatah sagarakhyo mahāyāsah,
Sagaraschakravartit āsit sāgaro yatsutah kūtsh.

'Bhāgavata-Purāna,' Skanda 9, ch. 8, slk. 4.

8. Jigāya prithvīm hatvā tālajāghān sahābhayān,
Sakānām pahlavānām cha dharmam nirasada-
chryutah,
Kshatriyānām munisteshthah paradānām cha
dharmavit.

'Brahma-Purāna,' ch. 8, slk. 32.

9. Manuscha sagaro raja paruto nāhushatmajah,
Ete te purvajah sarve yajnam kritva padam gatah.
'Padma-Purāna (pātala-khanda),' ch. 4, slk. 116.

10. Vubhuje prithvīm kritsnām marutta kshatriyā-
shabhan.

See 'Markandeya-Purāna,' ch. 32, slk. 4.

11. See the quotation from the 'Padma-Purāna
(pātala-khanda)' in connexion with Sagara.

12. Chakravartu tato jajne daushmantirnipasattamah.
See 'Vāyu-Purāna,' ch. 99, slk. 133.

13. Dushmantachakravartu bharato bhavat. Yannā-
maheturdevah sloko giyate.

'Vishnu-Purāna,' Pt. 4, ch. 19, Para 2.

14. Chakravartu suto jajne dushmantasya mahat-
manah, Sakuntalāyām bharato yasya nāmna tu
bhāratah.

'Brahma-Purāna,' ch. 13, slk. 57.

15. See the quotation from 'the Agni-Purāna' in
connexion with Prithu.

¹ See Eggeling, 'op. cit.,' Introduction, xxviii, xxix, xxx.

² 'Satapatha-Brahmana,' xiii, 5,4, 1-19.

³ The list in the 'Sāṅkhayana-Srauta-Sutra' (XVI, 9) has Janamejaya, Ugrasena, Bhīmasena, Srutasena, Rishabha Yājñatura, Vaideha, Alhara, and Marutta Avikshita.

⁴ Valakhilyādimunayo vyāsavāṇmiki-mukhyakāh,
Prithudilipo bharato dushmantah satrujidalī.
Agni-Purāna, ch. 219, slk. 50

in the *Agni*; ¹ Māndhātā in the *Bhāṣavata*,² *Agni*³ and *Brahma*,⁴ with his father Yuvanāśva in the *Agni*; ⁵ Muchukunda, son of Māndhātā, in the *Agni*⁶ and *Bhāṣavata*; ⁷ Yayāti in the *Brahma*⁸ *Linga*⁹ and *Padma*; ¹⁰ Purūravāh in the *Matsya*,¹¹ *Agni*,¹² *Mārkaṇḍeya*,¹³ and *Brahma*; ¹⁴ Harischandra in the *Brahma*¹⁵ and *Siva*,¹⁶ while his great-grandson Vijaya in the former *Purāna*; ¹⁷ Kāttavāya in the

mentions some *asuras* such as Hiranyakasipu, Vali etc., as overlords, while the *Devī-Purāṇa*¹ describes the *daiṭya* named Ghora as an Ekarāt. Sasavindu, son of Chitraratha, became a Chakravartti according to the *Linga Purāṇa*.² Yudhishtira figures in the *Skanda-Purāṇa*³ as the performer of a *Rajasuya* and five *Asvamedha* sacrifices, and as the conqueror of a good many independent princes, while Dilpa is mentioned in the *Agni*⁴ and *Pādma Purāṇas*⁵, as also in the *Mahābhārata*⁶ which enumerates a good many great kings of yore:—

NAMES OF PARAMOUNT SOVEREIGNS IN THE
Mahābhārata.

1. Marutta, son of Avikshita.
2. Suhotra, son of Atithi.
3. Vrihadratha, the king of the Angas.
4. Sivi, son of Uśinara, who brought the whole earth under subjection.
5. Bharata, son of Dushmanta.
6. Rāma son of Dasaratha.
7. Bhagīratha, son of Sagara.
8. Dilpa.
9. Māndhātā, son of Yuvanāśva, who subdued the whole earth extending from the place of sunrise to that of sunset.
10. Yayāti, son of Nahusha.
11. Amvarīsha, son of Nābhāga, under whom were hundreds of tributary kings.
12. Sasavindu, son of Chitraratha.
13. Gaya, son of Amurttarayas.
14. Rantideva, son of Sankriti.
15. Sagara of the Ikshāku dynasty, during whose reign "there was but *his* umbrella opened on the whole earth."
16. Prithu, son of Vena.

1. 'Devī-Purāṇa,' ch. 2, slks. 39 ff.

2. Sasavindustu vai rāja anvaḍvratamuttamam, Chakravartti mahāsatto mahāvīryyo bahuprajāh. 'Linga-Purāṇa' ('Purva-khanda') ch 68, slk. 25.

NAMES OF PARAMOUNT SOVEREIGNS IN THE
Kautilya.

The *Kautilya*¹ mentions a few emperors who though *chaturanta* lost their high positions through one or other of the vices. The list contains the following names:—

Dāndyākya-bhoja, Janamejaya, Aila, Rāvana, Dambhobhava, Vātāpi, Vaidehakarāla, Tālajangha, Ajavindu-sau-ira, Duryodhana, Haihaya-Arjuna. Vrishni-Sangha (the autonomous community of the Vrishnis) is also mentioned. Jāmadagnya, Amvarīsha and Nābhāga long "ruled the earth" through righteousness.

Of these, the first six and the last two as well as the Vrishni-Sangha are found in the *Kāmandakiya*² and *Sukra-Nīti*³.

EXAMPLE OF DIVISION OF SOVEREIGNTY
BETWEEN THE KING AND THE PEOPLE
IN SOUTHERN INDIA.

According to Mr. Kanakasabhai, India has seen not merely pure democracies or pure monarchies but also constitutions in which there were hereditary monarchs, between whom and the subjects there were distinct organs to restrict the powers of the former, and act as buffers. In this arrangement, there was an organized institution of the state to voice for the people's views. We find examples of such an organization in each of the three kingdoms of Chera, Chola and Pandya of the extreme south about eighteen centuries ago. There the hereditary monarch along with the "Five Great Assemblies"⁴ consisting of the representatives of the people, priests, physicians, astrologers, and ministers respectively wielded the sovereign power, and not the monarch alone. The first council safeguarded the rights and privileges of the people, the second directed all religious ceremonies, and the third all matters affecting the health of the king and the public. The fourth like the Roman

2. 'Kāmandakiya,' sarga 1, 54, 56, 57, 58.

3. It has the same verses as the 'Kāmandakiya.' See in this connexion Prof R. K. Mukerji's excellent work, the 'Fundamental Unity of India' ('from Hindu Sources'), which utilizes the lists of emperors from its special point of view.

4. 'The Tamils 1800 years Ago,' by V. Kanakasabhai, pp. 109, 110 quoting 'Chilapp-athikaram' II, 126; V, 157 and XXVI, 38; and 'Manimekhalai,' I. 17.

augurs fixed auspicious times for public ceremonies and predicted important events, while the fifth attended to the administration of justice, and collection and expenditure of revenue.¹ This system of government, there is

reason to believe, as Mr. Kanakāsabhai says, was not peculiar to the south but had its original in the Magadhan Empire of the North, from which the founders of the three kingdoms had formerly migrated.

metropolis for the transaction of its business and for holding its meetings. (Kanakāsabhai, p. 110).

1. Each council has a separate place in the

INDIAN PERIODICALS

Some Modern Ideas on Charity

is the theme on which Prof. M. Subedar writes thoughtfully in the pages of the *Social Service Quarterly* for July. A few sane ideas and methods of charitable relief have been set forth in the course of the article which should not fail to draw the serious attention of all interested in this very important and interesting phase of sociology.

The present day charity in India is unorganised and chaotic.

The aims of charity are perverted and its methods have become mischievous. Moulded as it is by traditions, there is little idea in the mind of the giver of gifts regarding his place in the great social machine. Nor does he think much of the true needs or the deserts of the man relieved. Anybody who will, can be a *sunyasīn* by merely donning a coloured garment. Anybody can plead misfortune or feign infirmity. The indiscriminate and thoughtless charity of these days has called into existence a large parasitic class, who are often able but always unwilling to do any work. Those who are supported by charity live on the borderland between gentile society and the criminal classes. They are the great recruiting ground for juvenile crime and prostitution. They have rendered by their persistent entreaties the streets of big cities difficult to pass through for honest and decent people. The common beggar is the most efficient carrier of physical and moral taint which he very often breeds. The places of pilgrimage have become centres of vice and crime. The priests have multiplied in quantity and degenerated in quality. Whether the Brahmin is paid the donor's weight in gold or silver, or whether he has to be content with a more modest gift befitting the impoverished condition of his *yajman*, the claims of hereditary priesthood, no longer regarded as a legitimate share from the social income but looked upon as charity, represent some of the most uneconomically spent resources of the country. Apart from the waste, the demoralisation resulting from these conditions is enormous.

The giving of gifts is not an individual's affair. It has important social aspects.

No one should be allowed to ruin the lives of

others by giving charity thoughtlessly. The end of true charity is not only to relieve people effectively from their immediate trouble, but to set them on a way to lead an honest, self-respecting, and independent existence; not only to give men the pleasure which comes from the satisfaction of urgent primary wants, but to bring them 'kalyana' or true happiness which never comes to those who are dependent and who have not done honest work. The individual donor who gives in the conventional manner on conventional occasions has neither the time nor the ability to think out all this. It is for those that shape law and social opinion to decide when and how and how much an individual should give. Restricted benevolence which does not touch the social misery is as much a sign of moral decay as lavish and indiscriminate bounty, which while keeping alive the edge of charity, equally falls short of the objects and is a symptom of social ill health.

The joint family system which secures great relief at present to a large number, who would otherwise be thrown on the charity of the community, is a doomed institution.

We should therefore prepare ourselves to meet these changes by adopting a sound system of charity. There should be registration of all charitable institutions and publicity for the work they do. We should have a Society for the Prevention of Mendicancy in India, which through law and opinion should make alms-giving obsolete. All *sadabratas* should be directed into socially useful channels. Above all, we should realise that charity is not an affair solely concerning the heart of the donor. It may be even better to knock the bottom out of the donor's pride by making him feel that what is given by him in charity is not always his own but what he has managed to steal from the community and that he shall restore it back, not when it pleases him but when and how the community demands it.

"The cry for educational reform is not confined to India alone. Countries far more advanced have their educational defects and drawbacks, for which they are eagerly seeking remedies." This is what V.

Subramaniya Iyer says in the course of a short article entitled

Education East and West contributed to the *Mysore Economical Journal* for July.

The writer is quite correct when he says that

the type of a University, especially in an old country, is to be determined not by the creative fancies of political theorists, but by the hard realities of various local conditions and other practical considerations, a fact which has been well put by the Central Provinces and Berar University Committee, in the words—"The University should grow naturally out of existing institutions rather than spring ready made from the brains of some University constructors."

Mr. Iyer then describes at some length the discussions going on in England for the introduction of more scientific teaching in the curriculum of the technical and other institutions. Turning from Europe to America one is struck by the growing importance of laboratory work there.

The days of those who say "This is what I *think*" are at an end, and of those who say 'this is what I *find and know*' are coming on. Still not a few of the Indian Educationists act in the belief that they have an instinctive genius for hitting upon the right remedies for India's Educational ills, without any of scientific enquiry. But in America we find ourselves in company with a different sort altogether. They are ever after experiments and results. Two valuable heads under which very useful information has been recently collected are:

- (1) Why children dropout of school early.
- (2) The ideals of Western children.

Unless a thorough enquiry is made under the former, no satisfactory scheme of universal or compulsory education, can be drawn up and no satisfactory curricula under modern conditions which are characterised by the socialistic and democratic tendencies can be formulated. The latter subject is of the greatest practical importance, in developing character which, as has been so often pointed out, is the highest object of education.

Tuberculosis and Social Reform

is the title of a very ably-written article contributed to the *Young Men of India* by Dr. Arthur Lankester and we commend it to the serious attention of the social reformer and the layman alike.

Civilization has doubtless given us many beautiful things but it has also brought evils in its train. The association between tuberculosis and what we may call the evils of civilization is very close indeed.

If civilization gives the palace and the beautiful suburb, it also brings the hovel and the slum. Warmth, fine clothing, and the other amenities of life, are purchased at the expense of the coal mine,

the factory and the weaving mill, and it is with this darker aspect of civilization that we find the disease of tuberculosis continually connected. Nowhere is this connection so obvious as in the numerous cases where savage races have been brought under the influences of "civilization" in a rapid and artificial manner, instead of the change being permitted to occur as a process of gradual, spontaneous development. It is tuberculosis which has been mainly responsible for the practical extinction of the Red Indian, the Maori of New Zealand, the aboriginal Australian, and many other savage races.

The deplorable state of things in Bombay and Calcutta which help the spread of tuberculosis is thus set forth by the writer:

In the Bombay *chawl*, the Calcutta *basti* hut, or the crowded dark houses of many an Indian city, we shall find everything that makes it easy for consumption to spread from man to man. We find dirty, airless rooms, opening by windows far too small upon side-streets, so narrow as to shut out all sunlight from the houses. We find inner rooms crowded with sleeping inmates at night-time, with windows or other apertures for ventilation either non-existent or entirely closed; and in most cases the relations of consumptive patients seem to be taking no precautions whatever to prevent the spread of infection. As we proceed with our inquiry, we shall find that it is amongst people whose constitutions are already weakly that cases of phthisis tend to be most frequent, and we shall realize that the conditions which are favourable to the spread of consumption are not limited to those which help the multiplication and distribution of the tubercle bacilli, but they include all factors which in any way tend to depress the vital powers and thus cause a predisposition to the disease.....

The selfishness of land owners, who utilize every square foot of available area for rent-producing dwellings, crowding storey above storey where the pressure of population gives hope of their being occupied; of the supineness of Municipal Committees, who are too often slow to take advantage of opportunities for acquiring sites which might be opened out for public use; of the joint-family system, which frequently results in houses being divided and subdivided in order to meet the needs of a gradually increasing family group, until both ventilation and privacy become almost impossible.

The problems of town-planning and of city improvement schemes, the difficulty of opening out over-crowded slum areas without causing still further congestion of the neighbouring habitations, the problem of how to provide for the poorest of the people dwellings which are free from the most glaring hygienic defects, while at the same time providing a due return on the capital expended with a rental which does not place them beyond the reach of those for whom they are intended; these, and many other similar problems of social importance, are all found to have a close vital connection with the spread of tuberculosis.

Our countrymen who are zealous advocates of *purdah* and who stick to insensible old usages should take note of the following:

Here, in India, tens of thousands of the very women, who should be the leaders of society, examples in hygienic living to the less fortunate members

of their own sex, are compelled by their social code to forfeit the blessing of robust health, and at the same time to sacrifice boundless influence which they might be exerting for the good of their country. That the results, as far as the prevalence of consumption is concerned, of this social custom are fully as serious as might naturally have been expected, is proved by the vital statistics of many Indian cities, which show twice, or even three times, as many deaths from the disease amongst women as amongst men, in communities where *purdah* is strictly observed; whilst in *non purdah* communities under similar climatic and other conditions, the numbers may be equal for the sexes.

Upon those who favour the retention of the system of *purdah*, there lies a heavy burden of responsibility to use every possible effort to provide, for those who live in seclusion, such accommodation as to ventilation, open spaces, and the like, that they shall not be deprived of the blessings of fresh air and exercise.

In many parts of India one cause, which was very frequently mentioned by experienced Indian doctors and others, of the prevalence of consumption amongst young women, was that they have to endure the physical strains consequent upon marriage and maternity at an age when, as yet, their constitutions are not fully developed. The diminution of the power of resistance to disease thus coincides in too many cases with an exposure to conditions fraught with danger to any who are in the least degree predisposed to tuberculosis. The almost universal practice of excluding all fresh air from the lying-in chamber results in a young girl being kept for days in an atmosphere insupportably close, and in which infective organisms must abound, just at the very crisis of her life when her vital powers are at their lowest. Out of sixty-four women, whose deaths from consumption were recently reported in a certain city, in no less than twenty of the cases there was the clearest history of the disease commencing immediately after child-birth.

Harischandra and the Place of the Drama in Indian Life.

K. T. Paul writing on the above theme in the *Young Men of India* for August says :

Harischandra, the Surya Vamshi, the Raja Adi Raja of Ayodhya! He had gone from the throne to the Mayana, not like Nala in well deserved failure at gambling, not like many another in consequence of ill government or defeat in war, not even like Rama in momentary obedience to an uxorious father's wish, but step by step of long drawn suffering, at every step, because he would not compromise principle for expediency. It is a great and thrilling message. The whole career a *via dolorosa* in which the brave man, of his own will, bore the cross on his shoulder right through even to the bitter end.

The tragedy of Hamlet is vacillation: the tragedy of Harischandra is the will that does execute. The tragedy of Macbeth is regnant passion: the tragedy of Harischandra is in self-control. The tragedy of Lear is in consequence of misplaced doting affection: the tragedy of Harischandra, in his deliberate willingness to sacrifice home and family, the tender fibres in his manly heart only serving to make the tragic trebly bitter. The tragedy of Othello is in the inequality of the noble soul to the wiles of the wicked: Harischandra did not suffer by ignorance, his was a deliberate choosing of the tragic—for to choose the other was to choose the false. Harischandra is the tragedy of the adamant will, which would not deviate to the smallest degree from principle and duty, paying for consistency every price demanded. Nor does he juggle with his intellect and emotions, and soothe himself by interpreting the sacrifice of power and family as religious renunciation. His regal soul loves power, his manly heart cherishes affection to the last. His are deliberate sacrifices, which continue to rankle in his mind. It is the crown of thorns with none of the points blunted. Harischandra finds suffering the inevitable consequence of righteousness in a world of evil. It all comes to him in the pathway of daily task, and accumulates naturally and normally.

FOREIGN PERIODICALS

Shaikh M. H. Kidwai continuing his interesting series on *Woman Under Different Social and Religious Laws* writes about

Woman Under Christianity

in the August number of the *Islamic Review and Muslim India*.

To save any misunderstanding the

writer says the following at the very outset, and we thoroughly agree with him.

We believe that human nature, as animal nature, is the same in the East and the West, the North and the South. The difference in latitude and longitude, in colour or even in creed, does not change human nature. There are good men and women and bad men and women everywhere. Woman as a woman is virtue-loving, sentimental, affectionate, gentle, sympathetic all over the world even when she is in

barbarous countries and under savage laws. Our respect and love for European woman, Christian woman, as a woman, i.e., when she is not unsexed, is great. We have no doubt that in a few respects the civilization that goes by the name of Western civilization is somewhat superior to that civilization which goes today under the name of Eastern civilization. In fact, we think that a union of the two civilizations, which can perhaps be quickened by intermarriages between the people under these two different civilizations, would evolve a very good civilization if it takes some of the good of the one and some of the good of the other to weaken the failings of the two.

Then the writer goes on to show "how Christianity, as a religion, a moral power, a social institution, has treated woman."

Christians do not recognize the immaculate conception of Lords Krishna and Buddha, but they feel proud of the immaculate conception of their "Saviour." Although they deny a father to their God or part of a God, they do not deny him a mother. And the major portion of them almost adore that mother too. Roman Catholics give a high place to the Virgin Mary in their pantheon of saints and gods. Yet all the Christians, reformed or unreformed, Catholics or Protestants, have based the very foundation of their religion on the criminality of woman. They have not only accepted the Hebrew story of the "fall of Adam," but have gone so far as to weave a network of blasphemous superstition round about it: that Eve ate the forbidden fruit first, and then instigated Adam to do so, who out of his love for her complied with her wishes so that she might not suffer alone the punishment of a revengeful God; that God sent them both down on the earth and the curse of their sin became ineradicable, so much so that every man born of woman is born in sin and the whole humanity required a saviour to satisfy by his own blood the wrath of a relentless, unforgiving, vindictive God; that the saviour, although a part and parcel of God Himself, came in the human form on this earth, was born of the Virgin Mary, lived for a few years among the fishermen of Galilee, claimed to be the King of Jews who put him on the cross, although he himself made every human effort to save himself from that ignoble death which was inflicted upon thieves and murderers, and with which his gospel—the Old Testament, in which he implicitly believed, had threatened false prophets. Thus the whole fabric of Christianity rests upon the criminality of woman. Pious and saintly Christians like St. Antony, St. Bonaventure, St. Jerome, St. Gregory the Great, and St. Cyprian, all cursed woman, and showered such abuses upon the sex as "the organ of the devil," "the foundation of the arms of the devil," "a scorpion ever ready to sting," "the gate of the devil and the road of iniquity," "the poison of an asp, the malice of a dragon," and "the instrument which the devil uses to gain possession of our souls."

Up to this day, under the marriage law of the Christian Church, a woman, when getting married, has to pledge solemnly to obey her husband. Both in Great and Little Russia, even to-day, the ceremony of the bride taking off the bridegroom's boots for the first time is very important. In certain parts of Great Russia the old custom still clings, that as the bridegroom is about to take the bride from her house, her father takes a specially prepared whip, strikes his daughter gently with it, saying he has done it for the last time. He then presents the whip to the bridegroom.

Jesus said that he had come to fulfil the Law, so he accepted "Thy desire shall be to thy husband and he shall rule over thee" as the maxim of a married life for women. Jesus himself, it is said, was disrespectful to his own saintly mother, and addressed her in a way which would never be allowed in any respectable society to-day. St. Paul, to whom modern Christianity is much more indebted than it is to Jesus himself, and whose personality, too, is much more historical, dictates: "Neither was the man created for the woman, but the woman for the man;" and again: "Let the woman, learn in silence, with all subjection, for I suffer not a woman to usurp authority over the man, but to be in silence." Woman cannot touch the pulpit and the altar. In the Church of England, by law, she is in practice counted a thing unclean. The gulf between the sexes in non-Catholic churches is as wide as in the Catholic.

Because of woman's criminality and the transmitted guilt, even the new-born infant of a Christian himself is subject to condemnation to the eternal torture of undying fire, until baptism has united it to the Church, for although it had committed no sin by its own will, it had nevertheless by its carnal conception drawn with it the condemnation of original sin.

The charge sheet, according to Christianity, against her is as follows:—

- (1) That woman was the first to disobey God.
- (2) That woman prompted Adam to follow her in disobedience.
- (3) That woman was the cause of the fall of Adam.
- (4) That women's guilt has been transmitted to the whole of mankind, and every child is born in sin.
- (5) That owing to woman's crime all humanity except a number of Christians is condemned to eternal perdition.
- (6) That woman is responsible if she is a Christian, is responsible to see that her own unbaptized infant goes to eternal fire.
- (7) That God had to send Jesus to be sacrificed because of the first crime of woman, so she is responsible for the crucifixion of Jesus.
- (8) That those who believe that Jesus was more than human have every reason to curse woman more for having caused "the death of their Lord."

Sensitiveness versus Independence.

The following cuttings from an article appearing in the *Spectator* under the above heading would be found interesting:

One is apt at first sight to decide that what we usually call sensitiveness is a weakness, unfortunate in private, disastrous in public life. We doubt very much whether this generally received opinion is correct. A man indifferent to report has probably some great qualities, but serious defects not infrequently appertain to them. The sensitive man has, no doubt, some weakness in his character, but he may have powers which the man made of sterner stuff is without. He can accept suggestion, and appropriate not only in appearance but in reality the moral and mental inspirations of other men. He has more power of development than stiffer natures possess. He is subject to change—more often for better than for worse. Even among public men we should imagine that in a democratic country it is uncertain which

type is the more useful. A man sensitive to criticism is sure to study his critics, and is likely to have more intuitive knowledge of their mental processes than one for whom they do not exist. He is a better representative than a more naturally independent person can be, and representatives are quite as necessary as leaders. Also, he may have a stronger feeling for justice. Unless he is an ill conditioned man, he will try not to give to the innocent the pain which he, being innocent, has received. He may try very hard to be just, even though he yields, when his resentment becomes excruciating, to the temptations of that malignant justice which we call revenge. On the other hand, the man who does not mind injustice will sometimes do injustice. Strong men are not always just men. In this respect they get far more credit than they deserve. Indomitable prejudice is a common corollary of strength. The man who is above resenting what is said of him is above revenging himself. He will not take offense, but he will not unscolded take the offensive, and that unjustly.

There are people who are absolutely indifferent to what even their friends say of them, because custom has made them content to be misunderstood. This very often happens where a particular member of a family is unlike all the rest. From his cradle he has learned not to expect sympathy. He may have been surrounded by love and be without the slightest bitterness, but he has learned to live alone, and to be tolerant of incomprehension. He does not think that any man's goodness or badness, ability or stupidity, depends upon the power to enter into his particular ideas. He would as soon have his mind to himself. He may even have come to value his mental solitude, and almost, if it were possible, to regard injustice as an extra lock upon the door of his castle. Complete reserve of this kind is rare, but it exists.

A few men and women who do demand sympathy, and do care about making a favorable impression, are too naturally exclusive to mind about public criticism in the least. They may belong to the great world, or they may be poor people living in the crowd, but their real life is among the few. Perhaps as many as half-a-dozen persons in the circle of their acquaintance are quite real to them—and to their criticism they may even be morbidly sensitive. As for the world, it beth in artificiality, and its joys and its sorrows, its anger, its wit, and its hate, are counterfeited. This view of life proves a man to be ill-endowed with imagination, but that is what absolute indifference to criticism more often than not means. But sometimes it goes with a singleness of purpose, a penetration, an enthusiasm, and a courage which are greater things than that idolatrously worshiped gift.

Newton Anticipated by Muslims.

Al-Qidwai writing in the *Islamic Review and Muslim India* for August asserts that the principle of gravitation was discovered by the Muslims long before Newton. They had discovered both the spiritual gravitation and the physical gravitation. Even their philosophical poets discussed it which will be evidenced from the following few verses of the famous mystic poet Jalal-ud-din Rumi:

*Jumla apai jahan san hukme paish
Just just o ashqane jette kharsh.*

It is owing to a law that all the components of the world
Are in pairs and couples, one loving and attracting the other.

*Hast h o ju way ba alam jutt khwah
Kast hamcho kahruba o berge kah.*

Every material body or part attracts the other in the world
Exactly as *kahruba* (amber) attracts a piece of straw.

*Asman gayad amin ra makhaba
Ba ta am hoon aban o ahamuba.*

The celestial bodies (sun and stars, etc.) greet the earth saying
We stand with you in the relation of magnet to iron (i. e. attracting each other).

*Gust val choon bimmet cen khakdan
Dermiane en methed asman.*

Somebody asked how it is that this dusty earth remains
Suspended in the circumscribing atmosphere.

*Hamcho qandile maslaq der hava
Ney ber asal mirast ney ber ada.*

Like a round lantern floating in the air,
Neither it falls down nor goes upwards.

*An hakimach guff ke jabe sama
A jehate shish binund under hava.*

The philosopher replied that it is because of the celestial gravitation
That the earth is suspended in the air from all the six directions.

*Choon i magnit'es quash raithta
Dermian mund shan amakhta.*

Just as in the centre of a hollow globe of magnet
If a piece of iron were put, it would remain floating.

Raffi—the Armenian National Writer.

The travails of unhappy Armenia have for long drawn the sympathy of the civilised world but very few people know the inner life of Armenia or the men of note she has produced.

In an informing article in the pages of the *Contemporary Review* Zabelle C. Boyajian tells the story of Raffi who, more than anybody else, reawakened the ideals of liberty and independence amongst his people.

We are told that

The whole of his literary work was one passionate cry for release from the terrible yoke that was weighing them down. In the remotest corners of Armenia, where his works were prohibited on pain of death, they were eagerly procured, read by torch-light in dark cellars, and passed on from house to house through secret passages. Armenia began to know herself.

Of the mass of novels, poems, and essays that he has left much is still unpublished. He was practically the founder of modern Armenian literature. The

Armenians possess a school of classical literature written in ancient Armenian—a language as different from the dialects spoken at the present day as from Italian.

Raffi formed a graceful and supple literary language out of the Armenian dialect spoken in the Caucasus. The pictures of Armenian life in his novels are drawn with truth and humour although they are rendered with a few simple strokes of the brush. They are fragrant with the scent of the mountain thyme and the odours of wet earth. But all this is made subservient to the main idea—that of liberty for his people.

The life-story of Raffi is thus set forth:

At the time of Raffi's birth, in 1837, Persian Armenia was so unsettled that it was impossible for the Armenians to export the produce of their lands themselves. The Persian merchants came once a year and bought up all the fruits of their labour at a nominal price. Raffi's grandfather was evidently a man of spirit, for he determined to take his goods through to Persia and sell them there himself. His caravans returned loaded with charcoal for burning in the newly-invented samovars, and at the bottom of each sack lay a handful of gold—the real guerdon which he was bringing back. So from his very earliest years Raffi was surrounded by the atmosphere of injustice and danger which is the lot of the Armenian peasant.

At the age of thirteen he was sent to the Russian Gymnasium at Tiflis, where he studied the Armenian classics. He wanted to become a doctor, but his father's affairs needed looking after, and he had to return home and attend to business. Living amongst his people, and seeing their sufferings, filled him with a desire to free them, a desire intensified by a journey into Turkish Armenia, where he visited the scenes of Armenian history, and met Muggeditch Khrimian, then a young monk at the convent of Varak, who was already working for the people by publishing an important newspaper and teaching them, amongst other things, modern methods of agriculture. Khrimian afterwards became the most beloved and influential Catholicos that the Armenian Church has ever had; and the friendship of the two young men lasted through life.

On his return to Persia Raffi wrote his novel 'Harem' which aroused the feelings of the Persians so much that he had to leave the country and go to Russia for safety. He settled in Tiflis where he spent the rest of his life in writing his novels and collaborating with Grigor Ardzrouni, the editor of the 'Mschak' (Labourer)—a paper which greatly assisted in forming the mentality of the younger generation.

Raffi died at the comparatively early age of fifty-one, and was mourned by the whole nation.

Intensely fond of Armenia as he was, Raffi was no lenient critic of his own people. The following taken from his historical novel *David Beg* is an instance in point:

—God knows that this nation deserves to have its throat cut, and I would do it myself if I could! I hate her, and yet I love her. She has been a wanton for nearly four thousand years. She was a slave to the passions of Assyria for centuries; during thousands of years she has thrown herself alternately into the arms of Greece, Rome, and Persia—even the black

Arab of the desert has touched her cheek with his thick lips. Which nation has she not been in love with, to whom was she not subjected? She gave herself to all, and was unfaithful to her own husband alone! And in spite of everything, I love this wanton, who has wasted herself through ages past, until there is nothing of her former beauty left. I love this skeleton—this envenomed body, contaminated, as it is, with a thousand diseases, and breathing death—diseases that she has contracted from the lovers she has exchanged for each other as one changes a shirt. I love her, but 'why' I do not know myself. I detest and loathe her but still I love her.

After centuries of inaction there is again a stir in the dead bones of Asia. Japan has already achieved great things and has found a place in the comity of the advanced nations of the world. Even in slothful China the young generation is no longer content to sit idle and let the grass grow under their feet. Their views on many a problem, on which they did not cast a thought up till recently, are undergoing considerable change. This is evidenced from a short article contributed to *China's Young Men* by Koo Ching Tjuan, a Chinese, on the

Moral Aspect of Physical Education.

The writer tells us that "it was regarded, in China, as beneath the dignity of scholars to engage in vigorous exercises, like running and jumping, which they thought were actions suited to naughty boys." But the writer holds that physical training and moral education must go side by side.

Bushido in Japan firmly grasped the moral ideals in bodily competition, and hence it fostered the spirit of daring and bearing, and above all it brought up the spirit of indifference to death, which pervaded the whole nation and laid the corner-stone of patriotism.

A close investigation into physical education reveals four fundamental characteristics, which are the essential foundations of a patriotic people.

First—Rectitude, or the absolute conformity to the rules of right principle or practice. Rectitude, I say, is the most cogent precept in physical education.

Second—courage, or the spirit of daring and bearing. Courage, in its real sense, means doing what is right. Confucius, in his *Analects*, defines courage by explaining what its negative side is. "Perceiving what is right," he says, "and doing it not, argues a lamentable lack of courage." So courage, in my opinion, is one of the most important requisites in physical education, as in everything else.

Third—Veracity, or truthfulness. Truth or falsehood in a man can best be detected in games. Modern educationists have made thorough use of games in the study of students psychologically.

Fourth—Loyalty. By loyalty we mean oneness of purpose. We mean a single aim at the progress

of an institution of which one is a member. We mean sacrifice for the welfare of the nation. In athletics we mean team spirit. Victory is often predicted for a certain team because the individual members are the best players. Those who make such predictions are ignorant as to what team work means. Hence, in group games, team spirit, or, more plainly, care for the team as a whole, is the essential factor in victory. On the degree of team spirit alone we may judge as to possible victory or defeat of a team. If the individuals of a team care more for their own accomplishments than they do for the team there would be discord, con-

fusion, chaos, the result of which would be defeat, shameful defeat.

Man's moral nature is nowhere more outwardly manifested than in games. There he involuntarily shows his moral nature, as if compelled to do so by some spiritual force. He cannot conceal it nor can he suppress it. If he be virtuous, his virtues will be noticed. If he be lacking in virtue, the want will also be noticed. Therefore, loyalty, as developed by long hours of practice, will be stronger and readier for emergency than the loyalty taught merely by words. Thus we see that loyalty is attained best through physical education.

IN JAPAN WITH MY MASTER

WE left San Francisco on the 20th March, 1915, by S. S. Nippon Maru bound for Japan. Sixty years ago the Japanese knew very little of navigation, but with their new spirit of enterprise and the encouragement they have received from their own Government they have almost succeeded in driving out of the Pacific all the rival shipping. The passenger service in the Pacific is now practically a monopoly of the Japanese. Their officers show great courtesy and every detail of a passenger's comfort is looked after with scrupulous care. In addition to commercial advantages this monopoly of navigation has given the Japanese political supremacy in the Pacific.

We arrived at Honolulu on the 26th March. This is in one of the Hawaiian Islands in the Pacific and is an important naval base of the United States. This island is elaborately defended by the latest methods of defence. There are several submarines in the harbour. On the day of our arrival there was a great disaster, one of the submarines had submerged itself for practice but it never rose again. Elaborate search was instituted but to no purpose.

Americans regard Honolulu as their most powerful naval base in the Pacific. A very large number of Japanese have, however, settled there, apparently for the purpose of trade. It is said that they are all trained military men and on the outbreak of any hostility between Japan and the United States it would be doubtful whether the Americans would be able to maintain their power against their Asiatic rivals.

Before reaching Honolulu my Master received a wireless message from the American University Club to give an address, but our stay in Honolulu was too short and the boat started the same evening for Yokohama.

Everyday we used to go up to see the chart of the previous day's run. The chart also gave the day of the week and the date. We had gone to bed on Friday the 2nd April and the next morning we found the calendar making Sunday the 4th April. There was thus an unaccountable vanishing of one whole day. We soon learnt that coming from the East we had just passed the 180° longitude. We have travelled round with the sun, which had lagged each day slightly behind. If the traveller circumnavigates the earth towards the East, he everyday meets the sun a little earlier. Hence there is a gain of a day. This loss or gain in the calendar at first appears very puzzling since at an identical moment to the East of a given mathematical line, it is Friday, whereas it is Sunday a few yards to the West of the line.

We were now nearing Japan; but something was causing us a vague and indefinite anxiety. We had hoped that my Master would be greatly benefited by the sea voyage but to our dismay we found him, for some unaccountable reason, getting more and more emaciated every day.

In alarm we consulted the ship's doctor, who regarded it as an effect of the sea voyage! We reached Yokohama on the 7th April; his condition became still more serious. We now realised that there had been some serious internal mischief since

the sudden suppression of his fever under medication at Harvard.

Fortunately we met with many friends, Indian, American and Japanese, who were eager to afford every possible help. It was arranged that the Emperor's physician should be consulted. He pronounced the illness to be very serious and thought that no relief could be expected from any medical treatment. At this juncture we had the good fortune of meeting Dr. Teusler, the celebrated American physician, Director of the International Hospital at Tokio. Dr. Teusler had followed my Master's work and was most anxious to offer his services. He regarded my Master's serious symptoms to be due to excessive mental strain and anxiety during the past year's lecture tour. In the case of any one else he would have felt hopeless, but since my Master had himself worked on fundamental reactions of life and of nervous reactions in general he would as a patient co-operate with his medical adviser. He drew out a scheme which was to be followed implicitly. The long course of lectures that had been arranged before the different Universities in Japan and various other engagements had to be cancelled with the exception of only two, and these only to be carried out after he had regained sufficient strength. For the present he would have to leave immediately for the sea-side sanitarium at Kamakura, where he would be completely cut off from the outside world and live in seclusion. The manager of the Hotel went out of his way and did everything possible for his comfort. Adjoining the Hotel was the long and beautiful sea-shore. Casting off all other thoughts from his mind he would take his walk gently along the beach and with a childlike enthusiasm he would gather specimens of marine life that used to be cast ashore by the tide. He now brought all the strength of his mind to cast off his illness, since he had much work yet to do in India.

WASEDA UNIVERSITY.

After three weeks' rest my master felt strong enough to give his lecture before the famous Waseda University on the 1st of May, 1915. The lecture hall was crowded with the most distinguished leaders of thought in Japan. The lecture and the demonstration were followed in breathless silence by the large audience. At the conclusion of the lecture, the President of the

University, Dr. Ukita, spoke in the most enthusiastic terms about the great message in science which had been sent to them from India. This was not the first occasion on which they had received messages of inspiration from that country. Many centuries ago Japan had been in close touch with India in her striving after intellectual and spiritual development.

RECEPTION BY MARQUIS TOKUGAWA.

On the 4th of May a reception was organised by Marquis Tokugawa at his residence at Tokio where my Master was received by the eminent professors of different Universities in Japan. We were greatly interested to meet these distinguished men, who are guiding the great educational movement of the country. The Japanese Government have for many years past been selecting the most promising students to obtain their post-graduate training at the most famous Universities in Europe and America. After they had distinguished themselves in these foreign Universities, they, on their return, are given professorships in their own University. The pay is very moderate, but it is the honour and dignity and the certainty of securing appointment in the University that have led the best students to devote themselves to the educational work. The success of her educational experiment is principally due to the continuity of policy that has been pursued in Japan. Even in Japan some of our Indian students,—by no means the best that India could send,—have won a very distinguished place in the University examinations; but we hear little of these students who had acquitted themselves with such credit in foreign countries. In America also we found that the Chinese were regarded as intellectually superior to the Japanese. But in China there is no continuity of policy, as in Japan, for utilising the services of their most distinguished students. Their strong sense of patriotism has also given a great impetus to the educational efforts of the Japanese. Every boy and girl in the school is taught the supreme duty of offering their lives for their country. Education is compulsory and it was a unique sight to see even the rickshaw-men scrambling for the latest edition of their newspapers to keep themselves abreast of the latest news. As an example of this I may describe a characteristic incident. Accompanied by two other

Indians I went to buy a few dwarf plants in a nursery. The woman in charge recognising us to be Indians began to speak enthusiastically about the discoveries of my Master, accounts of which she had read in the newspapers. When she learnt that I was his assistant, not only did she not accept payment for the plants but made a very liberal present of flowers!

We went to some of the Universities and scientific laboratories in Tokio. We were surprised to notice the great secrecy observed about the work that is being carried out in these laboratories. In India we are overzealous to show every stranger all our arts and crafts; we even organise exhibitions for the special benefit of foreigners so that they may find out without any difficulty our domestic articles and the process of their manufacture. The result is the complete suppression of our art products by cheap machine-made imitations. In Japan, however, things are quite different. Even in their Universities, which are supposed to be public, much formality has to be gone through. After a process of unlocking numerous doors we were led to see what was allowed to be seen. They are specially jealous in regard to the introduction of foreign manufactured articles, which are kept out of the country by heavy tariff. It is said that the only foreign articles they obtain are merely to serve as samples, which they reproduce with marvellous accuracy. In this even the trade-mark is not forgotten. We admired the beautiful posters of locally made Stephen's Ink which showed in a very realistic manner radiating streaks of blue black ink.

As far as natural resources go Japan is perhaps one of the poorest countries in the world. The arable land barely produces enough for the need of the growing population. The fisher folks ply their trade amid great danger and hardships. In spite of all their natural disadvantages, they have made themselves one of the great powers of the world. This is undoubtedly due to their frugality, endurance and their genius for details and, above all, their great love of their country. These find expression in their highly efficient and extended popular education. Whatever makes for the highest efficiency is taught to the boys and girls in the schools. From the look of the fields it would appear that the country could not be free from malaria. But the

lessons of hygiene and sanitation are so well taught and the civic responsibilities so well inculcated by the State that malaria is unknown in Japan. Even in remote villages every householder keeps his road front scrupulously clean.

Under pressure from the Western powers, Japan had to choose either to become modernised or lose her national existence. She followed modern methods, but soon excelled her Western preceptors. In the art of war, in statecraft, in espionage, they have left some of the most up-to-date Western nations far behind. One great characteristic weakness of the Eastern nations is what is known as 'eye-shame,' which interferes with their promptly utilising some special advantages irrespective of other considerations. But the Japanese statesmen are far above such weaknesses. They are ready at any moment to discard useless and embarrassing obligations and enter into new ones for their own national advantage. Their ever-expanding military system has imposed on them an intolerable burden which cannot be borne by the people for long. The problem before the Japanese statesmen seems to be, therefore, to discover new spheres of influence and new places 'in the sun,' in China or elsewhere.

My Master's health was slowly improving but he was not yet quite strong enough to undertake the voyage homewards. And so under doctor's order we left for the Hill Sanitarium at Myanoshita for a further stay of a fortnight. This was a region of great volcanic activity, where the hot springs are supposed to possess great curative properties.

• CHINA

On the 21st May we sailed for China. Our first port was Shanghai. This is a unique cosmopolitan city in the world. Every power worth a name has its own Government within the city. The many Chinese friends we made in America had arranged for us an extensive tour in China to visit the different Universities and the various historical places. But my Master was anxious to return home as soon as possible. At Shanghai, however, they organised a dinner in his honour where we met many leading Chinese gentlemen, among whom were a colleague of the ministry of the late President Yuan Shih Kai and Dr. Woo, the former Chinese am-

bassador at Washington. At that time there was great friction between China and Japan, Japan having made a series of demands which was most humiliating to the sovereignty of the Republic. The Chinese gentlemen, however, made light of the impending danger. They thought that China had a more perfect and ancient civilisation than the Japanese, who owed all their culture and civilisation to their Western neighbour. They had no doubt that the higher culture and civilisation of the Chinese would ultimately prevail. Instead of facing the problem of the present they thus benumb all their activity in dwelling merely on the glories of the dead past. Here we have the cause of the inefficiency of the Chinese in a nutshell. A highly cultured people, among whom were a very large number of young men, educated in the most up-to-date methods of the West, with newly awakened ideas of patriotism, are thus rendered powerless to resist the encroachment of a smaller nationality, more efficient and better organised.

From Shanghai we went to Hongkong. Our next port was Singapore, whence we arranged to go to Java to visit the famous botanic gardens of Buitenzorg. These gardens possess the richest variety of flora in the world. The ability with which these are accumulated and displayed are unique. There is a special establishment at Chibodas for scientific investigations which is open to all nations of the world. Here we expected to meet many botanical investigators from all parts of the world and also to make a new collection of plants suitable for our own investigations. And the other place we wanted to visit in Java was the most famous temple of Borobudur.

On arriving at Singapore we found that the place was under martial law on account of the abortive rising of the Indian soldiers. The steamer for Batavia was to leave within an hour of our arrival at the harbour. And on account of the war, the steamer service between Singapore and Rangoon was very uncertain. In this dilemma we had to abandon our trip to Java and we took passage in the French steamer which sailed almost immediately for Colombo.

We were now rapidly nearing Colombo, which I had left fifteen months ago. In this short time great things have been accomplished against insuperable difficulties.

We travelled from Colombo to London, from London to Vienna and back thence across the Atlantic to New York, from Boston to Washington and from New York to San Francisco, from there to Japan and China and back to Colombo. The length of the journey accomplished was over 26,000 miles. There was the added anxiety of personally carrying the delicate apparatus and our Indian plants, on whose well-being greatly depended the success of our scientific tour. Far more hopeless appeared the task at the beginning of our journey of converting the conservative leaders in science. There is a prevalent idea that in the realm of science there is always a keen desire for welcoming new truths. In reality things are quite different, for the leader of a particular branch of science occupies that position as the upholder of certain orthodox views, which, by the acceptance of new discoveries are liable to be completely subverted. Authoritative standard works, again, are in danger of becoming antiquated by the disturbing elements introduced by new facts and interpretations. It would thus be seen how new discoveries must inevitably rouse uncompromising opposition. When to this is added the further fact that the old views were challenged by a representative of a race better known for metaphysical subtleties than for power of accurate experimental investigation, then only would be realised the almost impossible task that lay before my Master. He had to look forward to no adventitious aid of any description from any direction but only uncompromising opposition. He went boldly to all the great centres which were opposed to his views and theories and by means of experimental demonstration of a convincing character succeeded in converting his opponents into enthusiastic supporters of his theories. He met all the leaders of thought of different nationalities of the world and won from them recognition of the very important service that his country is to render in the near future for the advancement of the world's knowledge. What was the other day regarded as impossible has now become a realised fact. In trying to get behind this great miracle the disciple realised that material advantages and favourable conditions are as nothing compared to the power of a consecrated life.

BASISWAR SEN.

REVIEWS AND NOTICES OF BOOKS

ENGLISH

The Sacred Books of the Hindus. Vol. XVIII—
Nov. 79—81. January to June 1916.
The Matsya Purana (Chapters 1—128). Translated by a
Talukdar of Oudh. Published by Babu Sudhindranath Vasu,
Pauam Office, Banurpuram, Allahabad. Pp. XVI, 360+69.
Annual Subscription—Indian Rs. 12-12-0; Foreign £1.

In this part chapters 1—128 have been translated and to complete the dynastic records of the Kings of the Kali yuga chapters 271, 272 and 273 have also been given in this volume.

The Introduction has been written by Professor Lalit Mohan Kar Kavyatirtha M. A. According to him the Kurukshetra war was fought in 1922 B. C. He arrives at this date from the data given in the Matsya Purana.

"The greater part of the present volume is taken up with a description of Vratas or fasts, followed by feasts and gifts to the Brahmanas. They are of interest to the Hindu public. To the Non-Hindus they are of very slight importance" (Editor's Foreword).

The volume contains ten appendices. The first appendix is on the character and the origin of the Puranas and is written by that gifted writer, Mr. B. C. Mazumdar. The second appendix is on the date of the Mahabharat War and the writer is Rai Bahadur Srisa Chandra Vasu Vidyarnava. In it he discusses the various views and arrives at the conclusion that the date of the war is 1922 B. C.

Appendix iii contains the translation of the chapters 271—273 which give an account of the Dynasties of the Kali Age after the war.

In Appendices iv—vii, genealogies of various dynasties have been given: Some of them are quotations from the Asiatic Researches.

Appendices vii and viii are on the Pauranic chronology and Geography and are written by Mr. Vasu.

In the Appendix x, he tries to fix the date of the Matsya Purana. He says:—"As the Chronology of the Matsya Purana does not go beyond the Andhra dynasty, so, in its present form, it cannot be posterior to the year 225 A. D., if that date be taken as the termination of the Andhra according to Mr. V. Smith. It would be 432 A. D. according to the Matsya Purana. It is, therefore, one of the oldest, if not the oldest of the Puranas. The Vayu, The Visnu, and other Puranas mention the Gupta and other dynasties that came into existence after the Andhras and so they, in their present form, are later than the Matsya.

Albiruni saw a manuscript of the Matsya Purana in his time, so it must have existed then."

According to him, "this Purana, in its original form, was recited on or about 1160 B. C."

These appendices are very learned and valuable and are indispensable to the students of the Puranas.

The second part of the book will be published in future but the first part is complete in itself.

The Sacred Books of the Hindus Vol. XVIII Part I (July 1916; No. 85). THE BRAHMOGANISHAD SARA SANGRAHA. Translated by Vidyatilaka. Published by Babu Sudhindranath Vasu at the Pauam Office,

Banurpuram, Allahabad. Pp. X+80. Price Re. 1-8. Annual Subscription—Indian Rs. 1-12-3; Foreign £1.

The Brahmoaganishad Sara-Sangraha-Dipika is a small collection of some Upanishad texts to which is attached a Sanskrit commentary by an anonymous author.

The book contains 150 quotations and 141 of these have been traced to their original sources. The remaining 9 quotations have not been identified. Of these, the first has been quoted by Sankara in his commentary on L. 2. 25 of the Vedanta Philosophy and by Ramanuja on the commentary; on L. 2. 26. The 31st mantra has been taken from the Brahma Vindu Upanishad or Amrita Vindu Upanishad (12th mantra); the 33rd from Matrayana (6. 18); the 45th from Narayana (13); the 104th from the Brahma-Hridaya Upanishad (39) and the 115th from the Brahma Vidya-Upanishad (12). In some of these mantras, a word or two have been changed. This may be due to different readings or due to the fact that the mantras have been quoted from memory.

The quotations are disproportionate. The Chandogya Upanishad has been altogether ignored and there are only two quotations from the Brihad-aranyaka Upanishad. On the other hand 13 mantras have been taken from the Kaivalya, 12 from the Brahma-Vindu and 9 from the Mahanarayana.

The book contains (i) A preface, (ii) An Introduction (8 pages), (iii) Sanskrit Texts of the Upanishads, (iv) English translation of these texts, (v) Dipika in Sanskrit, (vi) An alphabetical Index of the Upanishad Texts.

MAHESHI CHANDRA GHOSH

A GIST OF MR. TILAK'S GITA-RAHASYA OR KARMA-YOGA SHASTRA (*The Hindu philosophy of life, Ethics and Religion*) by V. M. Joshi, M.A. Publishers: Dug-zekar Brothers, Benaulia, Benares City. Pp. 15+88. Price 8 Annas.

"All of us know that Mr. Tilak had to spend his days in seclusion at Mandalay from 1908 to 1914. During this period he wrote his new thesis, the *Gita-Rahasya* or *Karmayoga-shastra* in Marathi, of which he has made a special study for these forty-three years.....Its English version, we hear, is to be made at no very distant date and it is already in process of being translated into all provincial languages of India. In the meanwhile the sooner the eminent thoughts of the great thinker are made known to our innumerable non-Marathi-knowing countrymen the better it will be for them." (Foreword)

And so Mr. Joshi of Poona has made an outline of the book which is presented to us in the little volume under notice. The book has been written well in appreciation of Mr. Tilak's work, briefly summarizing its contents, and giving suitable reply in the last two chapters to the unfavourable criticisms passed hitherto in western India both by the English-educated scholars like Dr. Bhandarkar and shastris or Sanskrit Pandits.

The secret (रहस्य) of the Gita according to Mr.

Tilak, as described in the Gist, is कर्मयोग known to be so considering the two cardinal, and yet very simple points, one of them being starting and the other concluding, viz. (1) Arjuna asked ought I to fight or to shirk fight? (2) and the response is that he was so persuaded to fight that he actually promised to do so. And consequently all the verses of the Gita are to be so interpreted that they can "mark some progress in the line."

It seems good and reasonable. But it is to be considered that whether in the Gita things relatively different from the *Karmayoga* are also explained to Arjuna, who is not to be regarded merely as one wanting to ascertain in the juncture that whether it is advisable to fight with those who are closely related to him for a transitory kingdom, but as one, who aspires after emancipation as his goal of life, but finding the way not very easy to decide, approaches a great person for his instruction. And accordingly the Instructor points out the way, the only one way,

the different parts of which are called कर्मयोग, भक्तियोग,

and ज्ञानयोग and if one of these parts is not followed, naturally the journey will be an incomplete one, and so a traveller cannot do without any one of them. Thus they have their own importance, and so if anybody discard one part of the way, laying every stress on the other so as to regard others as nothing, he would do it to no purpose.

And thus the promise of Arjuna in the end of the dialogue that he would do what Shrikrishna advised him (करिष्ये वचनं तव XVIII 73) refers not only to fighting or कर्मयोग but कर्मयोग, भक्तियोग and ज्ञानयोग

alike. It is what occurs to us and the readers are at liberty—to accept or reject—we need not say.

What is obscure to one is very clear to another. It entirely depends on individual intellectual capacity. Moreover, men naturally think differently and judge a thing from different standpoints. And it is impossible to stop it. And thus it is quite natural that the text of the Gita has so many commentaries, the number of which is increasing daily. And in almost all of them one finds something new in one or other way, and this adds to the knowledge of mankind. Let it be *Karmayoga* or something other which Gita teaches, it being the common point of dispute from time immemorial, but the importance of Mr. Tilak's work in other respects is a great one, as shows the gist under notice.

It is to the credit of Mr. Tilak that we now have the hopelessly lost verse of Ishvara-Krishna's *Saukhyā-karika* which was originally composed in seventy verses of Arya (आर्य) metre, but unfortunately one of them was lost. Even in the present editions of the oldest commentary on them by Gauḍapada only sixty-nine verses are to be met with. Yet from the very commentary Mr. Tilak has succeeded in finding out the lost verse when reading the above commentary on the 61st verse which undoubtedly shows, another verse commented upon in it "and Mr. Tilak has synthetically reconstructed it as follows :—

कारणमीश्वरभेदे, द्रवते कालं परे स्वभावे वा ।

प्रजाः कथं निर्गुणतो व्यक्तं कालः स्वभावश्च ॥"

The reconstruction is very excellent far as the

first, second, and the fourth *padas* of the verse are concerned, but according to the rule of Arya metre in which the whole work is composed the third *pada* cannot be admissible, for in Arya a जगत् or मध्यमगुण is not to be used, but the *pada* in question contains it (प्रजाः क). We, therefore, suggest a different reading like the following one, though we are not quite satisfied with it : लाकः कथमगुणात् स्यात् ।

Those non-Marathi-knowing persons who desire to learn briefly and in a suitable way the contents of the work of one of the greatest thinkers of the present generation of Indian people should gratify their desire by going through the pages of Mr. Joshi's little volume, which contains also a short life and character sketch of the great Marhatta leader.

VIDYUSHEKHARA BHATTACHARYA.

A VEDIC GRAMMAR FOR STUDENTS, by Arthur Anthony Macdonell, M.A., Ph.D., Boden Professor of Sanskrit in the University of Oxford, Fellow of Balliol College; fellow of the British Academy; fellow of the Royal Danish Academy, including a Chapter on Syntax and three Appendices, List of Verbs, Metre, Accent, Oxford, At the Clarendon Press, London, Edinburgh, Glasgow, New York, Toronto, Melbourne and Bombay, Oxford University Press. Pp. vii + 508 Price 10s. 6d. net.

Professor Macdonell's name has been familiarized to every one of those who cherish any love in any way for Sanskrit literature by his works on Vedic subjects including the *History of Sanskrit Literature*. In 1910, his contribution in the form of the *Vedic Grammar* to Buhler's *Encyclopedia of Indo-Aryan Research* was a brilliant one. It is a large volume of 486 pages closely printed in very small types containing matters written in that condensation which is one of the special features of the series. His work is, however, so extensive and detailed being rather a reference book for scholars, that general students can not be expected to master its contents thoroughly. This is what has persuaded the Professor to write again a book on the same subject by which he has really removed the want of a volume which has so long been desiderated.

The present work is not to be regarded as merely an abridgement of his large *Vedic Grammar* though it has to a great extent been based on it, but in fact is a supplement to it. Owing to the limitation imposed on account of its being a volume of *Encyclopedia of Indo-Aryan Research* the author was obliged to exclude much matter from his large *Vedic Grammar* with which he has dealt in the present one, adding chapters on Outlines of Syntax, and Conjunctive and Adverbial Particles and an Appendix of alphabetically arranged forms of every verb given in the body, and describing also the Vedic matters. The general treatment of the subject is excellent and is what may naturally be expected from a savant of Professor Macdonell's rank.

In explaining Conjunctive and Adverbial Particles the author appears in some cases to have entirely ignored the significances handed down traditionally. For instance take the word कुविद् which is given in the *Nighantu* (III. 2. 1) as one of the synonyms for वदः and we do not find any fault with the meanings

based on it as explained by Indian commentators even in the passages quoted by Prof. Macdonell in support of his suggested meanings. बु has a number of meanings as given by him, and Sayana has also explained it by different words such as अदादि, इदानोम् क्रिष, खलु, etc. Sometimes the (immediately, at once) latter takes it to mean लिप्रम् as in R. V., I. 145. 1 (p. 238), but the author does not speak anything of it.

In desideratives बोभन्म (बोभन्सो) is given in both the grammars of the author from the root वृष, but according to Panini (U. 1. 6) it is from वष, the actual derivative from the former being विवृषिषे as has also been noted by him as used in Brahmanas.

Considering the immense merit of the books these defects are very insignificant. So there is not an iota of doubt that the work will prove a great boon to students of the Vedic language.

Max Muller is said to have prophesied that he had no doubt that the time would come when no Indian unable to construe the Vedic hymns would call himself a Sanskrit scholar. It was forty years ago, but the time has not yet come in India. It is undoubtedly due to a considerable degree to the want of a practical Vedic Grammar. But Indians have now before them the required book and they should at once set to work. Let them write a similar book, having in view the requirements particularly of Indian students, first in Sanskrit and then render it into different vernaculars. They should no longer remain inactive in this branch of learning of which they are so much proud.

VIDYUSHEKHARA BHATTACHARYA.

BIBLE LESSONS FOR USE IN ZENANAS, by Edith M. Ansell, price 5 as

THE PROPHETIC GOSPEL, by L. P. Larsen, price 3 as.

Christian Literature Society for India.

Both these books are intended to assist teachers in Bible classes.

THE QURANIC DOCTRINE OF GOD, by H. R. H. Gardner, 5 as.

This is far above the usual level of missionary books and it would be well if all missionaries in India were to read it, so that they might avoid some of their irritating misrepresentations of Islam. Even Muslims may read this little book with profit for though they may not agree with everything in it they will find nothing unfair. There are numerous quotations from the Quran and they have been admirably chosen.

THE HOLY QURAN WITH ENGLISH TRANSLATION AND EXPLANATORY NOTES PART I, Anjuman-i-Taraqqi-i-Islam, Qadian, Punjab, India. Rs. 2.

The Translation and Notes are in accordance with the views held by the sect which believes Ghulam Ahmad of Qadian to be the promised Messiah. Sometimes the renderings differ from those generally accepted, but in all cases the differences are due to theological motives. The commentary is of hardly any value, but it contains a few interesting quota-

tions. The printing however deserves very high praise. This is, we think, the best printed Quran we have seen. All the verses are numbered. As there are to be thirty parts and each part costs Rs. 2 the price of the whole book will be prohibitive for most Muslims. The following extract will show the opinions of the sect: "We take this opportunity to convey to the world at large the glad tidings that the Blessed Messenger of the latter days, whose advent was foretold by almost all the great prophets of the world, made his appearance in due time, in the person of Hadrat Mirza Ghulam Ahmad of Qadian..... If we carefully consider the prophecies of these great prophets, we find that it was of one and not of different Messengers that these ancient sages of different nations spoke. All these prophecies pointed to the appearance of the Promised Teacher in the East. Isaiah said "Who has raised the righteous one in the East." Jesus likened his second advent to lightning that flashes from the East to the West; the Holy Prophet of Islam also pointed to the East. Nay he even named the very place where the promised Mahdi was to appear. He called it Kad'a, a name which is quite like the name Kadi or Kadian as the birth place of Ahmad is called."

H. C.

KEIGWIN'S REBELLION, 1683-4, AN EPISODE IN THE HISTORY OF BOMBAY, by Ray and Oliver Strachey. (Oxford Hist. and Lit. Studies, No. 6, Clarendon Press, 1906), xvi + 147, 3 illus. and 2 maps. Price 7-6 net.

This history of "a unanimous and bloodless revolution by which Bombay island was lost to the Company for nearly a year," is one of the best fruits of the specialisation which has at last happily begun in the study of Indian history. For the history of the E. I. Co. the original materials are all preserved in England among the manuscripts of the India Office; and if a writer works in India alone, no amount of industry among the printed books and few MS. records at the Bombay Secretariat or Imperial Record Office, which are the only things available in India,—can atone for his lack of such primary sources of information. Messrs. Strachey have made the fullest use of "the rich mine in the India Office," viz. original correspondence, factory records, court books, &c., and with the happiest results. Many current errors have been rectified, and many dark and neglected nooks of Bombay history lighted up. The first four chapters give us the most lucid, correct and fresh account of the early history of the English in Western India,—their internal government, state of society, foreign relations, problems and policies,—as yet published.

Captain Keigwin's mutiny and usurpation of the government of Bombay in 1683-84, had its precedent in Sir Edward Winter's usurpation of the government of Madras (Sep. 1665—Aug. 1668.) Both were the work of the white troops in India, and proceeded from the same cause, viz. the belief of the malcontents that a policy of pure trade, a policy of peace with the country powers and retrenchment of civil and particularly military expenditure, was impossible and that "a forward policy to keep the natives in awe" was necessary. (Wilson's *Early Annals*, i. 39-40.) The abolition of the illegal gains of the English soldiers at Bombay, such as "false muster,"—led to Keigwin's outburst. We, therefore, see that the white officers who conspired to murder Clive for abolishing the "double batta" and

those who planned a mutiny against Lord Ripon for introducing the Ilbert Bill (*vide* Cartoon in *Punch*), merely represented a school of Anglo-Indian thought known from the very infancy of the British dominion in India.

We close this excellent book with our memories sadly going back to the late Dr. C. R. Wilson who utilised materials in India and England alike, with no less power of criticism and elucidation than the authors of the work under review, but whose *Early Annals of the English in Bengal*, remains, alas! a fragment.

JADUNATH SARKAR.

I. THE VILLAGE GODS OF SOUTHERN INDIA, *by the Right Reverend Henry Whithead, Bishop of Madras, Oxford University Press. Price Rs. 1.*

In this small book of 172 pages we have an account of the *grama-devatas* of southern India—the Tamil, Telugu and Canarese countries—and of the folklore connected with them. According to the author, 'this form of Hinduism represents a pre-Aryan cult of the Dravidian peoples, more or less modified in various parts of southern India by Brahmanical influence.' Many of these village gods are of quite recent origin, e.g. Plague acuma, the goddess of Plague, temples to whom have been built during the last ten years. The gods of higher Hinduism, Siva and Vishnu, represent world-forces, and are the outcome of philosophic reflection on the world as a whole. But the village deities symbolise only the facts of village life, and are related, not to great world forces, but to such simple facts as cholera, small pox and cattle disease. The infliction and removal of diseases is the special function of all these deities, whose name and number is legion, and who are usually females. The images or symbols by which they are represented are almost as diverse as their names. Their dwelling places, contrasted with the magnificent temples dedicated to Siva or Vishnu, express the meanness of a religion of fear. They are almost universally worshipped with animal sacrifices and Pujaris or ministrants are usually non-Brahmins, and sometimes even outcastes. Even where there is a Brahman Pujari, he never takes part in the animal sacrifices, and even so, is degraded by his connection with the shrine. The Indian villagers pass their lives in constant dread of the evil spirits by which they believe themselves to be surrounded, and the sole object of the worship, if such it may be called, where there is no idea of sin or repentance or gratitude or love or moral or spiritual blessings, is to avert their wrath. The religion of about 80 p.c. of the Hindu population in southern India being the worship of the village goddesses, it would be wrong to hold that the Hindus, as a body, are a race of philosophers. The worship of the *grama-devatas* is the religion of ignorant and uncivilised people, whose thoughts do not travel beyond their own surroundings and personal needs. "At the same time, it is also true that morally the Brahmanical system has sunk to lower depths than have been reached by the cruder religion of the village people. The worship of the village deities contains much that is physically repulsive... But still, it is also true that, setting aside a few local customs in the worship of the village deities, there is nothing in the system itself which is quite so morally degrading and repulsive as the Lingam worship of the saivites, or the marriage of girls to the god and their consequent dedication to a life of prostitution among the Vaishnavites. If the wor-

ship of Siva and Vishnu has risen to greater heights, it has also sunk to lower moral depths than the less intellectual and less æsthetic worship of the *grama-devatas*." As for the origin of the worship, the people can afford but little help in explaining its significance, for whenever asked they come forward with the usual reply that it is 'mamul' or custom. Though propitiation seems to be the main idea of the cult at the present day, the author thinks that communion with the world soul was the original idea. The main object of eating the flesh or drinking or smearing the blood of animals was to absorb this soul stuff and appropriate the special virtue which belongs to the animal. The author speaks of the 'crude butchery and coarse bloodshed,' 'the wild orgiastic excitement,' sometimes even the drunkenness and immorality, which prevail at the festivals, and 'witness to a low and unworthy conception of deity.' The village deity is 'the product of fear untouched by philosophic reflection.' "In the writings of Hindu philosophers and poets there are many noble and inspiring thoughts, but there is nothing in the vast jungle of beliefs and practices that have grown up during the course of ages around the worship of the village deities that the Christian could wish to preserve." Nevertheless, the 'worship of the village deities has maintained a silent protest on behalf of religious and social equality.' By investing non-Brahmins with priestly duties 'it has had more influence than we imagine in keeping alive in the hearts of the depressed classes some slight feeling of self respect and a sense of their own worth in the community.' "In the second plan, deep down in the system, buried beneath a mass of traditional rites which have lost their meaning, there is still the instinctive craving of the human heart for communion with God... It certainly brings religion down into the everyday life of the people. The ordinary villager of southern India does nothing without offering prayer to the village deity, while the shrines and symbols that are scattered all over the countryside keep constantly before his mind the existence of a spiritual world."

It is in this attitude of the mind towards the spiritual world, fostered by the belief in the village deities, that the author sees 'a preparation for the Gospel.' 'The mental attitude of the ordinary villager is the very antithesis of materialism or agnosticism.' In other words, the Bishop of Madras would utilise the very religiosity of the Hindus, of which Hinduism boasts, for the spread of Christianity in the land. But on the reverend Bishop's own showing, this sense of dependence on the spiritual world is the product of gross and often morally reprehensible superstitions, and the latter can only be removed by the inoculation of a wholesome dose of unbelief. Therefore, if the spiritual sense of the masses of the Hindus is to be refined and elevated, this cannot be done by embracing the superstitions of Christianity, but by educating them in the higher tenets of their own philosophy, which is not untinged with agnosticism as the author calls it, or rationalism as we should prefer to put it. The progress of the human mind from superstition does not lie through superstition into superstition, but through rationalism into enlightened spirituality. Incidentally, Hindus will note the value which the learned Bishop, unconsciously perhaps, puts on the deep religious feeling of the masses of the Hindus, and to what use he wants to put it. If Hindus would preserve their religion against the insidious attacks of Christianity, they must either remain satisfied with the popular supers-

titions and the present low level of rural life, or infuse among the people a healthy spirit of rationalism.

We cannot close this brief review without paying a compliment to these learned Christian writers, who show such a great improvement on their predecessors in the philosophical interpretation of Hindu cults and creeds. They proceed to their task with sympathy and knowledge, and what they say of Hinduism can no longer be brushed aside as shallow or prejudiced. There is much food for thought in these pages for every educated Hindu who is sincerely desirous of the welfare of his religion. As an honest and careful piece of research work and study the book deserves to be recommended to all who are interested in the future of Hinduism.

II. THE POPULATION PROBLEM IN INDIA : A CENSUS STUDY :—by P. K. Hattal M.A., Assistant Accountant General, Bombay. Bennett, Coleman & Co. Price Rs. 1.

The author tries to prove that population in India is growing beyond the means of subsistence, and advocates an artificial limitation of births as the only practical remedy. He recognises that his suggestion is thoroughly unconventional, but he wishes it to be understood that "this essay should not be construed into an attack on the spiritual civilisation of the country or even indirectly into a glorification of the materialism of the West... There is no greater curse to an individual than poverty—I say this with due respect to our spiritualism." The author declares that his suggestion should not be regarded as immoral. "The ultimate test of a moral or a non-moral act is... whether it does or does not conduce to the preservation of the race. Our existing social customs are more non-moral in this sense than any system of artificial limitation can possibly be." He notes and disposes of the other objections to the remedy advocated by him, but it is not these which will give his book the value it undoubtedly possesses. The merit of the essay lies in its able handling of certain census statistics, from which we cull a few. Early marriage is so universal among females that only 6 per cent of our women are unmarried at the reproductive age. In the district of Darbhanga, which we presume, is the headquarter of orthodoxy, as many as 58 p.c. of boys and 62 p.c. of the girls are married between the ages of 5 and 10. Though the birth-rate in India is higher in India, the fertility of women is not so high as in England. "Premature maternity tends to exhaust the frame and impair the capacity for further child-bearing rather than to add to the number of the population. The most prolific races in India... are those which are least addicted to child-marriage, viz, the Animists and the Mahomedans." The natural increase of population is often in inverse ratio to a high crude birth-rate, for in countries where the birth-rate is high the death rate is also high, and where the birth-rate is low, the death-rate is also low. In Asiatic countries, India has the highest birth-rate; its death-rate is also the highest. Japan has the lowest birth-rate; its death-rate is also the lowest. Thus our high birth-rate is no matter for congratulation; our death-rate being also high, our increase is much smaller than countries like England, Scotland and even Ireland. Herbert Spencer says: "Organisms multiply in inverse ratio to the dignity and worth of individual life." According to the writer, our high birth-rate is an indication of the primitive state of our society and

an evidence of civilisation of an unsophisticated type. "It is no sign of the exuberance of vital force either. Let us remember Herbert Spencer's dictum, 'every generative product is a deduction from parental life' Fecundity must, therefore, affect longevity." The average expectation of life of a male in England is at birth double that of one in India, and in the case of a female, it is more than double. What is more alarming, the figures for the last three censuses show a progressive decline in vitality, whereas just the reverse is the case in England. "This is of course *a priori* to be expected. With the progress of medical science and sanitation and better conditions of living for the population as a whole, every stage upwards in civilisation must lessen the chances of death." Again, infantile mortality is very high—just double of what it is in England. Indeed, wherever there is a high birth-rate, the mortality among infants is also generally high. This is due to premature birth and debility at birth, which again is the result of early marriage. Everybody marries, whether fit or unfit, at the earliest possible age permitted by Nature. The number of female deaths at the reproductive ages is quite as serious. This is specially the case in Bengal, where child marriage is most common. Joseph Korosi of Hungary and Dr. Dunlop have shewn, by carefully prepared natality tables, that while a delay of three years in the consummation of marriage in the case of the wife reduces the average size of the family by approximately one child, it requires a delay of some forty years on the part of the husband to effect the same reduction. This shows that by delaying the marriage of boys without marrying our girls at a much later age than is customary we have begun at the wrong end. Our high death rate has had the effect of diminishing the respect and sanctity with which human life is regarded in civilised countries. The loss of an only child is missed keenly: but two or three are not missed in a family of eight or nine children. The writer then proceeds to discuss the problem of emigration as a remedy for overpopulation. On this point he has some very plainspoken truths to tell, which is no doubt very laudable for a Government servant. That the Indian labourer "does not move is really due to the fact that he is not welcomed as an immigrant anywhere either within or without the country, and in places where his labour is needed onerous restrictions are placed on his elementary rights as a citizen, so that he recoils from the prospect of working under those conditions." Mr. Wattel quotes Sir Henry Cotton and shows that the cry of the alleged scarcity of labour proceeds from interested parties who are not willing to pay living wages, and the paternal interest evinced by the planters for their labourers is really not any deeper in significance and more generous in motive than the care bestowed on the horse or any other instrument of production. The constant subdivision of holdings necessitated by the law of equal division of property among male heirs, and the multiplication of numbers, have increased the pressure on the soil to breaking point. The low density of population in certain parts of the country is due solely to the inhospitable character of the soil. As for Bengal, "with the exception of one or two districts, the province must wait either for the clearing up of the Sunderbans or the drainage of marshy tracts or for the disappearance of malarial fevers before it can furnish room for further considerable expansion" of population. Emigration has no promise for the overflow of the other provinces except in Assam, but there

Kala Azar and contract labour stand in the way. The outcasts of Madras used to emigrate largely to Burmah, but the Burmans are waking up from their indolence and sloth, and the Madras will soon lose his predominance in that quarter. The Indians are not wanted in the self-governing colonies, the chances of inter-provincial migration are not promising, and the pressure of population on the means of subsistence being already keen, our last hope lies in increasing the productivity of the soil by irrigation. Here the writer quotes largely from the report of the Irrigation Commission and other authoritative works, and comes to the conclusion that "there are certain very definite limitations on the usefulness and extension of irrigation which well-meaning enthusiasts are apt to ignore." The Irrigation Commission in its report declared that if the programme sketched by it be carried out by the year 1925, "the limits to the area which can be protected by State Irrigation works at a cost which will not be prohibitive will be within sight." The effects of canal, tank and well-irrigation are then discussed, and regarding the first, the author holds that "while affording immunity from famine to the tracts through which the canals pass they cause considerable injury by (1) depriving the riverain lands of the full benefits of river flooding (2) spreading malarial fever owing to the excessive moisture diffused round about and (3) causing a deterioration of the soil, experience having shown that the tendency on the canal-irrigated lands is for the outturn to diminish. From all these facts, the conclusion, according to the author, is irresistible that voluntary restraint in married life is the only remedy against the prevalence of such positive checks to over-population as famine, plague and malaria. The book is nicely printed at the Times Press, Bombay and amply repays perusal.

III—V. *Sir Sankaran Nair: Behramji M. Malabari: Sir Edwin Arnold. Natesan and Co, Madras, Price four annas each.*

These three booklets, the first two of which belong to the "Eminent Indians" series, and the last to the "Friends of India" series, are in the best style of Messrs. Natesan and Co's publications, and contain a mass of useful and interesting information. Sir Sankaran Nair is a living politician and administrator, Malabari was a social reformer of far-reaching influence, and Arnold was an interpreter of the East to the West in a far better and nobler sense than Kipling. Short accounts of their lives, activities and teachings, plentifully interspersed with quotations from their speeches and writings, are bound to prove useful for ready reference and instructive to the general reader. We are glad to find that these cheap publications are being appreciated in England, as we have had occasion to know from casual references. To us they are highly valuable.

POL.

BENGALI.

ASOKA ANUSHASAN, text, Sanskrit and Bengali translations, and notes, by Charu Chandra Basu and Lalit Mohan Kar, Pp. xxx+131, 6 illus. (Calcutta, 1915) Rs. 2.

It is difficult to imagine a more inconvenient arrangement of the matter than that adopted in this book. The texts of all the inscriptions are given first, then all the Sanskrit versions, then all the Bengali renderings, and lastly the notes. The reader who wants to study a particular inscription has to

keep his fingers in four different places in the volume. We beg pardon, it should be five places; for the plates are not given opposite the pages they refer to, but are scattered throughout the volume at the caprice of the binder. The proofs have been very carelessly read, while the minutest accuracy is necessary in a work of this sort with the least pretension to scholarship. The plate of the Rummīnī Dei inscription bears the direction "see page 80," whereas the subject is treated on pages 38, 49 and 88 only. The puzzling word *atha bhagīve* in this edict, is rendered in Sanskrit as *artha-bhagī* (p. 49) and in Bengali as *ashta-bhagī* (p. 88). Evidently the Sanskrit form is due to a misprint, P. 129. *Bhabra* is given as *Bharta*. The geographical notes (pp. 126-130) are full of misprints, mistakes and obsolete information. No reason has been given for the editors' failure to supply Sanskrit versions of Rock Edicts 10-13 (p. 47), while the others are given.

The first and hitherto only version of Asoka's inscriptions in Bengali was issued about 30 years ago by Kṛṣṇa Bihari Sen, on the basis of the antediluvian *Corpus Inscriptionum Indicarum*, Vol. I. A new version, taking account of all our recent information on the subject, is highly to be desired. But Babu Charu Chandra Basu's work, though published in 1915 is about a decade behind modern research and altogether ignores the work lately done in elucidating the edicts, by contributors to the *Indian Antiquary*, the *J. R. A. S.* and other journals of learned societies. In addition to the Asoka bibliography given in V. A. Smith's *Early History of India*, 3rd. ed., pp. 172-174, the following "Asoka Notes" have appeared in the *J. R. A. S.* April and July 1914 (Thomas), October 1914 (Hultzsch), Jan. 1915 (Thomas), July 1915 (Aiyangar),—while studies on the same subject by Charpentier, Aiyangar and Jayaswal have appeared in the *Indian Antiquary* in 1915 and 1914. Vincent Smith, Dr. Thomas, Hultzsch and Fleet are not such names in the field of Indian research that Babu Charuchandra Basu can pass over their opinions in contemptuous silence. The Royal Asiatic Society of Great Britain is not such an obscure body nor is its *Journal* so difficult to procure that a writer working in Calcutta can be excused for not consulting it. No great brain power is required for the work; only a little industry and the spirit of the fullest investigation of truth. But that industry and that scientific spirit have not been shown by the editors of the book under review.

We should be sorry if this book is regarded as an example of the way in which the latest school of historical students in Bengal do their work.

JADUNATH SARKAR.

HINDI.

OTHELLO by Pandit Govind Prasad Ghildyal, B. A. Printed and published by Vishwanath Sharma at the Lakshmi Narayan Press, Moradabad. Crown 8vo. pp. 168. Price—1s. 8.

This is an almost literal translation of the drama of Shakespeare. The metrical portions have very infrequently been rendered into metre and the translation, though not of the very high order of similar translations of Shakespeare's dramas, is yet satisfactory. We wish to see all Shakespeare's dramas in Hindi, hitherto only a few being translated. The language of the translation in the drama under review is good on the whole. The author has followed the method of the annotators of English classics, in giving an introductory review of the drama; and

the book will prove perhaps most useful to English students studying the drama. There are printing errors in the book, but it is neatly bound.

SANSKRIT SAHITYA KA AITHASIK ANUSHILAN by *Indra Vaidyanath, Gurukul, Kangri and printed at the Gurukul Press, Kangri. Royal 8vo. pp. 61. Price—As. 6.*

This gives a historical sketch of the Sanskrit literature and points out the philological and other changes brought about in it through the influence of the different periods of Indian history. The examination of facts is fairly critical and we agree in the main with the views of the author. The language sustains the reputation of the author in his other publications. The printing and get-up are fair.

M. S.

MARATHI.

ARYANCHYA SANANCHYA PRACHIN VA ARWACHIN ITHASA or *the ancient as well as modern history of the Aryan festivals* by 'Rigvedi' Publishers Arya dharmavicharak Mandali, Bombay. Price Re. 1-8-0. Pages 304.

In these days when a good deal of interest is created in the minds of young men in the history of their nation in its political, social, religious and other aspects, the publication of a work tracing the history of our festivals to their origin, noting the transformations they have undergone in the course of centuries, describing the present stage of growth or decadence and making useful suggestions to restore them to their pristine greatness or to adapt them so as to suit our present circumstances, must be considered very opportune. The variety and amount of information, the lucidity of the style, the nice way of presenting the subject matter so as to make it palatable, the balance of judgment discernible throughout the work, the breadth of view and the instruction and enlightenment it gives, are some of the most attractive features which ensure commendation and warm appreciation from the public, both of orthodox and reformed views. The book is undoubtedly a valuable addition to the existing Marathi literature.

BHUTACHA BAGULBOWA or *the Fallacy of the Devil* by Mr. Ramkrishna B. Naik Mandrupkar. Pages 182. Price Re. 1-8. Published by the author himself at Bijapur.

This is the third edition of Mr. Naik's brochure on the question of the existence of evil spirits. The author has considerably succeeded in his commendable attempt to dispel the widely prevalent, yet foolish and harmful notions about spirits. Mr. Naik has taken considerable pains in taking both a common-sense as well as a scientific view of the question of the existence of evil spirits and allied subjects, and though his attempt may not succeed in entirely removing the deep-rooted superstitions from the minds of the ignorant, it will surely set educated people a-thinking and carry conviction to those who have a reasoning turn of mind. It is necessary that some means should be devised to bring the book within the reach of the ignorant masses among whom peculiar notions about ghosts, goblins and apparitions are largely prevalent.

BHARAT-SEVAK—*A monthly magazine edited by Mr. R. G. Pradhan B. A., L. L. B., and published*

at Poona. Annual Subscription Rs. 2-8-0 including postage.

This is a high class magazine and embracing as it does all subjects of human interest peculiarly affecting the people of India, it should command respect and carry influence with the educated people. In the July issue of this periodical a prominent place is assigned to an article from the pen of Rao Bahadur Sardar M. V. Kabe M. A. on the subject of compulsory education, which should attract attention and invite thoughtful consideration of educationists and educated parents, if for nothing else, at least for the peculiar view entertained by the writer that it is wrong to advocate the imparting of education to children through their mother-tongue, and that far more beneficial results are likely to accrue by making English, the medium of instruction even in Primary schools—a view not shared by the majority of educated Indians. We wish a long and prosperous career to this new venture.

V. G. APTE

GUJARATI.

JAGA VIKHYAT PURUSHO, PART III, by Ratna Sinh Dip Sinh Parmar, published by the Society for the Encouragement of Cheap Literature, printed at the Diamond Jubilee Printing Press, Ahmedabad. Cloth bound pp. 11. Price Re. 0-8-0. (1910).

This part of the famous men of the world series contains the lives of Demosthenes and Sir William Wallace. The first is a translation from Marathi, and the other of a Hindi version of a Bengali work by Babu Yogendranath Bandopadhyay.

ARTHASHASTRA NAN SIDDHANTO, PT. I., by Jekisan L. Barbhaya. Printed at the Lady Northcote Orphanage K. N. Sailor Printing Press, Bombay. Paper cover. pp. 132. Price unpublished. (1910).

Gujarati Literature does not overflow with original works on Political Economy. In fact, the last book on the subject, and that too, a translation of Mrs. Rawcett's work was published years ago. Under the circumstances a really good book on the subject is a desideratum, but that can come only from the pen of a person who has saturated himself with, and made a serious study of it. The present writer has made "jack" of many, as appears from the way in which he describes himself as the author of books on widely differing matters. His title therefore to write on this highly scientific subject appears to be exiguous, and we really admire his temerity in trying to popularise Political Economy, by means of a book, which both in style and matter, cannot be characterised otherwise than as stilted. The very title of the book is found fault with, and certainly it errs in grammar: possibly that is a printer's error, but the start fairly represents what follows. At times one finds the writer arrogating to himself more than the honors of English text book writers, e.g., where he says that he has produced diagrams which would be found in no other work. We think the author knows fairly well that the book will not be found suitable for that class of people—the ordinary merchants—who are primarily meant to be benefited by it. The trumpet sound under which the writer of the foreword introduces the book makes us doubt the genuineness of the admiration under which he wrote its few lines.

Kheti & Sahukarya, a quarterly magazine: We do not review magazines.

(1) *Bharat Dardasha Darshana*, (2) *Bharat no ushat kal*.

These are two leaflets issued by a Society called *Shishu Mandal*. We cannot easily realise what *Shishus* (infants) have to do with these "high" subjects. We think the labor in writing them is lost, so far as "infants" are concerned.

The housefly. This is a small treatise written about the evils of the house fly by Dr. J. D. Munsiff for the Broach Sanitary Association, and reproduces well known facts.

History of Baroda. This history of Baroda and its rulers is published by the State and is well written.

A COMPARATIVE REVIEW OF THE PURAN STORIES OF INDIA AND EUROPE, by J. P. Joshipura, M.A., printed at the *Lakshminilas Press, Baroda*. Thick Card-board, pp. 78. No Price. (1916).

The title of the book shows very well what it contains. The writer has been at great pains over the subject matter of his work, and furnishes not only interesting reading, but food for thought. To those who do not know much about the origin of our Puranic legends, there is much to learn here, and to those who know about them, there is an opportunity given for checking their inferences or conclusions.

K. M. J.

NOTES

Causes of National Strength.

In his book on *Physics and Politics* Walter Bagehot devotes his second essay to the discussion of the question why one nation is stronger than another. "The answer," he says, "is that there are very many advantages—some small and some great—every one of which tends to make the nation which has it superior to the nation which has it not; that many of these advantages can be imparted to subjugated races, or imitated by competing races; and that, though some of these advantages may be perishable or imitable, yet, on the whole, the energy of civilisation grows by the coalescence of strengths and by the competition of strengths."

By far the greatest advantage is, in his opinion, the acquisition of the *legal fibre*: "a polity first—what sort of polity is immaterial; a law first—what kind of law is secondary; a person or set of persons to pay deference to—though who he is, or they are, by comparison scarcely signifies." This represents the first stage of civilisation. When a nation has got a fixed law or a custom, the second step which it has to make is the "getting out of a fixed law," "breaking the cake of custom," breaking through it and reaching something better. The reason why there have been so many arrested civilisations in the world is the inability to break through custom. For, as the author puts it, "one most important pre-requisite of a

prevailing nation is that it should have passed out of the first stage of civilisation into the second stage—out of the stage where permanence is most wanted into that where variability is most wanted; and you cannot comprehend why progress is so slow till you see how hard the most obstinate tendencies of human nature make that step to mankind."

"Of course the nation we are supposing must keep the virtues of its first stage as it passes into the after stage, else it will be trodden out; it will have lost the savage virtues in getting the beginning of the civilised virtues; and the savage virtues which tend to war are the daily bread of human nature."

The Political Advantage of Monotheism.

Bagehot has also discussed the kind of morals and the kind of religion which go to strengthen nations. He expresses the opinion that "Those kinds of morals and that kind of religion which tend to make the firmest and most effectual character are sure to prevail, all else being the same; and creeds or systems that conduce to a soft limp mind tend to perish, except some hard extrinsic force keep them alive. Thus Epicureanism never prospered at Rome, but Stoicism did; the stiff, serious character of the great prevailing nation was attracted by what seemed a confirming creed, and deterred by what looked like a relaxing creed. The inspiring doctrines fell upon the ardent character, and so confirmed its energy. Strong

beliefs win strong men, and then make them stronger. *Such is no doubt one cause why Monotheism tends to prevail over Polytheism; it produces a higher, steadier character, calmed and concentrated by a great single object; it is not confused by competing rites, or distracted by miscellaneous deities. Polytheism is religion in commission, and it is weak accordingly.* But it will be said the Jews, who were monotheist, were conquered by the Romans, who were polytheist. Yes, it must be answered, because the Romans had other gifts; they had a capacity for politics, a habit of discipline, and of these the Jews had not the least. The religious advantage was an advantage, but it was counter-weighted."

There are reasons for thinking that what Bagehot says is true. There is no flaw in the abstract reasoning; and history furnishes corroborating examples. One reason why the Musalmans were able to conquer India was undoubtedly their monotheistic faith and their consequent comparatively greater national or communal solidarity than that of the Hindus. In North-Western India the Sikhs prevailed for a time,—no doubt partly because of their energising and unifying monotheistic faith. The influence of an overmastering idea or the predominating worship of a dynamic god or goddess may also tend to make a nation strong for a time. For example, the "Maharashtra-Dharma" which the Saint Ramdas, spiritual preceptor of Sivaji, taught, combined with the worship of the goddess Bhavani and of Siva the destroyer, conduced to produce a firm, steady type of character which gave the Marathas ascendancy for some generations. When in Europe the Musalmans overran and conquered most of the southern and central countries, they were undoubtedly more monotheistic than the Christians. In the Christian cult of that age in the countries conquered Mary, Jesus, and numerous saints and saintesses, and their images, and the tombs, shrines and relics of holy persons had thrown God altogether into the background. In modern Europe, too, speaking generally, the most progressive nations are those which are least idolatrous or polytheistic, considering protestants and rationalists to be less polytheistic than Roman Catholics.

It may be said the Musalmans are more

monotheistic than Christians; why then are the former not a predominant people now? We may reply, in the words of Bagehot, that, the religious advantage of the Musalmans is an advantage, but it is counter-weighted. What these counter-weights are, it is not the object of this note to enumerate.

Our Average Income contrasted with Prisoners' Expenses.

Sir Robert Giffen (1837—1910) was a financial journalist, statistician and economist whose high authority and practical experience were universally recognized in Great Britain. He was chief statistical adviser to the British Government, president of the Statistical Society and a Fellow of the Royal Society. At the meeting of the British Association in 1903 he put forward estimates as to the aggregate income and wealth of the people of different parts of the British Empire. The aggregate annual income of India was put down at £600,000,000. As the population of India is in round numbers 300,000,000, the average annual income of Indians per head is £2 or Rs. 30. Similar estimates were made by Lord Cromer (then Major Baring) and by Lord Curzon. Probably all these estimates were based on the same data, furnished by the British bureaucracy in India. Indian statisticians and British statistical writers like Digby have not accepted these estimates as correct. They consider them far too optimistic. Let us, however, accept this official estimate as accurate. We should bear in mind that Rs. 30 is not the minimum annual income of Indians per head. It is only an average, which means that there are higher incomes as well as lower incomes, and the average represents a sort of mean. There are millions upon millions of Indians whose annual income is less than Rs. 30. There are again large numbers of persons who have no income at all,—who subsist on charity or by thieving. But let us take the annual income of Rs. 30 per head as the basis of the comparison with the expenses of prisoners which we are going to institute.

Jail regulations are in no country based on the idea that prisoners are to be supplied with comforts or luxuries. The idea everywhere is to supply them with the barest necessities of existence, so

that they may not die and may be able to preserve their health and do the tasks assigned to them. Let us now see whether it is possible for Indians outside jails to command those bare necessities of life which convicts in jails are supplied with. We shall not take into consideration all the expenses incurred by the jail department in connection with prisoners. We shall consider only three kinds of expenditure viz., those on diet, bedding and clothing, and medical treatment. The following table is compiled from the Annual Reports of the Jail Department in four provinces for the year 1915.

SOME ITEMS OF JAIL EXPENDITURE PER CONVICT IN 1915.

Province.	Diet.	Bedding and Clothing.	Medical.	Total.
C. P. and Berar	31-4-9	4-2-11	2-1-4	37-9-0
U. P.	41-3-0	4-7-3	2-11-8	48-5-11
Bihar-Orissa	43-9-9	4-10-10	6-13-1	55-1-8
Bengal	17-7-0	6-2-3	7-10-10	61-4-1

In the Central Provinces and Berar the expenses were the lowest. But even there the total of only the three kinds of expenses considered amounted to Rs. 37-9-0, or Rs. 7-9 more than the average income of an Indian. It will be seen that this income of Rs. 30 per annum would not be sufficient even for the diet-money of a prisoner in the Central Provinces and Berar, not to speak of the other Provinces, where the expenditure was higher. It may be argued that among the Indian population outside prisons are included large numbers of children, whose living expenses are less than those of adults, and that the jail average is mainly, though not entirely, for adults. But, speaking generally, growing children do not eat very much less than adults; and the totals for the four provinces mentioned in the table are more than our average income of Rs. 30 by Rs. 7-9-0, Rs. 18-5-11, Rs. 25-1-8, and Rs. 31-4-1 respectively. Moreover, it should be borne in mind that the non-convict population of India has various items of expenditure in addition to those included in the table. They have to build and repair their hovels, huts or cottages, they have to incur expenses in connection with the confinement of the mothers, they have to or ought to educate their children, they have to perform the religious rites and celebrate the social functions in connection with births, initiations, marriages, deaths, &c., they have to take part in the

religious festivals of their respective sects, they have to visit places of pilgrimage, and they have also to incur travelling expenses in connection with other journeys undertaken for discharging domestic or social obligations.

How then do the hundreds of millions of indigent Indians make both ends meet? Well, the plain answer is, the ends do not meet, or rather they meet in the grave-yard or in the burning-ground.

But, it may be said, that this is mere poetizing, it is not a hard matter-of-fact answer. Yes, it is poetry,—grim tragedy of a sort, if you like.

A hard, matter-of-fact answer may also be given. Rs. 30 represents the income, and the expenditure is much greater. Whence does the balance come from? Well, the balance need not come in at all. The patient population of India have discovered a way out of the difficulty. They meet the extra expenditure by starving or fasting, by wearing rags or going naked, by dwelling in hovels unfit for cattle or in no-houses at all under the open sky, by themselves and their children remaining illiterate, and, when they or their children fall ill, by not going in for any medical treatment at all. They are of necessity believers in the faith cure. Some go on borrowing as long as they can. Families remain involved in debt from generation to generation. Some lead the lives of hangers-on on their near or distant relatives. The more enterprising among the needy have recourse to thieving. Those who are bolder still and unscrupulous resort to dacoities though all dacoits are not of this description.

From life-long semi-starvation to dacoity, all the evils mentioned above are social maladies that require a patient diagnosis and effective remedies. But the officers and imps of the C. I. D. are not the kind of doctors which society requires.

The Evils of Indigence.

Let us enumerate some of the evils of indigence. They are mal-nutrition, weakness, short lives, epidemics, premature deaths; nudity or semi-nudity, bad health, vice, crime, disease, death; want of shelter, exposure to sun, rain and other inclemencies of the weather, disease, death; ignorance, illiteracy, insanitation, shortened life, untimely death; superstition, emasculation, timidity or cowardice, fatalism, approxi-

mation to animal existence ; mendicancy, parasitism, and the consequent loss of self-respect and manliness.

Wherever there is the cowering servility of the indigent, there is also the corresponding bullying tyranny of the man dressed in a little brief authority, derived either from official position, or from the possession of wealth. Thus are the wrongs of the weak and indigent avenged. Let all men who have to do with the poor beware of this nemesis. All wrongs rebound and hit back the wrong-doer by degrading him.

Income and Wealth of the British Empire.

We give below Sir Robert Giffen's estimates, of 1903, of the aggregate income per annum and wealth of some parts of the British Empire in millions of pounds sterling, with their population in 1911 in approximate millions.*

AGGREGATE INCOME.

Country	Income	Population
United Kingdom	1750	45
Canada	270	
India	600	
South Africa	100	

In the above table the population figures are for 1911, whereas the estimates of income were made in 1903. In 1911 the income of other parts of the British Empire must have increased. We cannot say the same for India with certainty. Taking the figures as they are, the income of Indians is seen to be miserably small.

WEALTH.

Country.	Wealth in millions £s.	Population in millions.
United Kingdom	15,000	45
Canada	1,350	7
India	3,000	315
South Africa	600	6

We very much doubt whether the wealth of India has been at all correctly estimated. Anglo-Indian officials are interested in presenting to the world a very rosy picture of India's financial position. Hence all official estimates of India's income and capital should be received with caution. But even if their accuracy be taken for granted, what a sorry figure India cuts ! The wealth of Britishers is £333 per head, of Canadians £193 per head and of South Africans £100 per head. But the wealth of Indians is about £9½ per head.

India's Poverty and Allied Problems.

The utter indigence of hundreds of millions of Indians is itself a great evil. It is nothing but unmitigated wretchedness to have to go without sufficient food, sufficient clothing and sufficient shelter. But our poverty gives rise to other problems and makes their solution difficult. There can be no progress in sanitation and education without adequate progressive expenditure. But where is the money to come from ? Poverty, again, cannot be removed, unless people have healthier and stronger bodies and more alert and enlightened minds.

Even with her present revenues much could be done for the good of India's children. But as the control of both income and expenditure is in foreign hands, the progress of India is not the sole or main consideration. The remedy, therefore, is Home Rule. But Home Rule, again, depends on the enlightenment of the masses. So let us resolve to make whatever progress we can in all directions. This does not mean that all problems are of equal importance ; it only means that they are interdependent. The attainment of Home Rule is unquestionably the most urgent and important political and economic problem before the country.

The Home Rule League.

A Home Rule League has been established in Madras, and more than thirty branches have been established all over the country. Home Rule literature is also in circulation. All this is good news and encouraging news. Well done, Madras.

What we do not like is the reappearance in another form of the old line of demarcation between "Moderates" and "Extremists." Moderates remain where they were, only "Extremists" flock round the new banner of Home Rule. This is much to be regretted. We think the political ideal of all earnest Indians is *in substance* the same, though the names given to it may not be the same. Why then divide ourselves along party lines ? We know even the old difference between Moderates and Extremists in Bengal was in the case of many men more personal than as regards questions of principle or political ideal. Are we never to be able to sink our personal differences ?

In Calcutta some thirty men met together and have formed themselves into a Home Rule League. No public notice of

the meeting seems to have been given; at least we saw none. No letters seem to have been issued to men likely to be interested in the matter; at least we received none.' We write in the way we are doing, simply to say that Home Rule is not the hobby of a small clique, it is a question which has aroused the enthusiasm of the entire educated public, and that, therefore, the formation of a Home Rule League ought to have been considered a matter of sufficient importance to prevent its being done in the perfunctory manner in which it seems to have been done. There was nothing to conceal, nothing to be afraid of. Why then this want of publicity and this hurry?

The first use in India of the term "Home Rule."

The way in which Mr. Dadabhai Naoroji used and explained the word *Swaraj* and demanded the thing for which it stands, in his presidential address at the Calcutta Congress of 1906, makes that term equivalent to Home Rule, though he did not use the latter expression.

There is not the least doubt that the person who has done more than anybody else to bring the problem of Indian Home Rule within the range of practical politics is Mrs. Annie Besant. So, it is not with a view to minimising her achievement that we point out the inaccuracy of her assertion in *New India* that "On September 14th, 1915, the first use, so far as we know, was made of the name Home Rule in Indian politics." The expression was used much earlier in this Review. In fact, we published an article under the heading "Home Rule for India" in June, 1907. It is a small matter, but it is good to be accurate in matters of history.

The Governor on Internments.

In one of his Dacca speeches H. E. the Governor said that an officer qualified to be a High Court Judge [why not an actual High Court Judge?] examines the evidence brought forward by the police against suspects, and persons are interned only after he has been satisfied. But we think it is still police evidence on which people are punished. It is only with the aid of the best counsel that sometimes persons accused of heinous crimes are able to prove that they are innocent and that

the evidence adduced against them is concocted. Seeing that counsel's help is so necessary for dispensing justice, and seeing that in important cases two or three judges sit together to try a case, we think there ought to be an advisory board to sift the evidence on which persons are interned. And there ought to be in these cases a Public Defender. A leading lawyer ought to be appointed to this post. The experiment has been tried with success in America. Public prosecutors are appointed practically to secure the conviction and punishment of the guilty. But the protection of the innocent is equally the duty of Government. On this ground we advocate the appointment of a Public Defender, who is to be Government servant bound to secrecy. No one should be interned in any unhealthy locality. Even in the healthiest of places, restrictions placed on freedom of movement and want of proper physical exercise, combined with mental disquiet and depression, injuriously affect the health of the persons detained. A person's place of detention should under no circumstances be more unhealthy than his usual place of abode and business. There should be frequent periodical medical examination of the interned.

Many bread-winners of families have been interned. Their allowances should be such as to enable them to maintain both themselves and their families.

The Indian Association on Internments

In this connection, we fully endorse the representation on the policy and procedure of internments submitted to the Government of Bengal by Babu Surendranath Banerjee on behalf of the Indian Association. Recently scores of persons have been arrested and interned. Most of them are young men and students. Bengal is not in a state of siege; it is far removed from the theatre of war. Under the circumstances, we cannot but strongly protest against placing the province under a sort of martial law. The reign of the police informer and the spy should cease and the responsible high-placed servants of the Crown should assert themselves and act according to the principles of wise and far-seeing statesmanship. Lord Curzon's contempt for public opinion and consequent autocratic proceedings have been the root-cause of all the subsequent political troubles and unrest. If police informers'

and spies, whose occupation depends on the continuance of the present state of things, are allowed to poison the minds of the highest officers in the land against the youth of Bengal, the latter must continue to be looked upon with suspicion and treated accordingly. There is a moral certainty that a considerable proportion, if not the majority, of the persons suspected are being treated unjustly. Injustice rankles in the minds of even those who may be considered weak and despicable, and no man can foresee and prevent the evil consequences of such embittered feelings. The mistake of Lord Curzon and his subordinates ought not to be repeated in a different form.

We write as we do because the ruined hopes and baffled lives of many promising high-souled young men grieve us sorely. We would fain see the country make rapid strides along the paths of peaceful progress and development.

We may incidentally notice the attempt made by certain Anglo-Indian journalists to belittle the representation of the Indian Association on the alleged ground of Babu Surendranath Banerjea's not being a representative of Bengal. And why? Because, forsooth, he was not elected a member of the Imperial Legislative Council. As if that Council is at all truly representative of the country, and as if the present-day law-makers of India are also its representative-makers. Babu Surendranath Banerjea possesses to-day as much representative character as he did before the days of the last election. It is true, he did not then and he does not now represent all sections of the educated public, but he does represent a large proportion of them.

Besides, the important point is purposefully ignored, that it is not Babu Surendranath who speaks in his individual capacity, but it is as a mouthpiece of the Indian Association that he speaks. And the Indian Association, though not fully representative of the entire educated public of Bengal, is more widely representative than any other association in the province.

Further Repressive Legislation Foreshadowed.

The following paragraph from the Bengal Police Administration Report for 1915 seems to foreshadow, at least to seek to prove the need of, further repressive legislation :—

SEDITION'S LITERATURE.

Increased activity in the circulation of seditious leaflets came to notice about June and continued throughout the year. Under the existing law, mere possession of seditious matter is not an offence and consequently there are no means of checking this serious evil at the fountain head. It is only after seditious and inflammatory matter has been circulated and the mischief done, that the law can be put in motion. There is convincing evidence that the revolutionary party in Bengal depend largely upon seditious literature to recruit their ranks and several youths have confessed that they were drawn into the movement through reading the leaflets issued by the revolutionists. Penalising the possession of seditious matter may not be a complete cure for the evil but it will materially assist to check it.

The law of sedition in India is such that many classical works and others of undoubted authority and value may be brought under it; and the possession of these may be made penal under the new law indirectly demanded. And if there be an official demand, there will be an official supply. But where and when would the limit of repression be reached? Even at present during house-searches copies of the *Gita*, and some works of distinguished Bengali authors are, quite unwarrantably, seized by the police. Will and can Government prepare and circulate a complete *Index Librorum Prohibitorum*, and issue up-to-date supplements daily or weekly?

The human heart is the real nursery and factory of all things good, bad and indifferent. That place cannot be searched by the police and the effects taken possession of and removed. Therefore, that alone would be a radical remedy for sedition which would prevent people from thinking and feeling seditiously. Can British statesmanship tackle this problem or can it not?

The Governor in Council has not either endorsed or disapproved of the Inspector-General's indirect suggestion contained in the paragraph quoted above.

In Praise of the Police.

The Bengal Police Administration Report for 1915 has this to say in praise of the Police Department :—

THE YEAR'S WORK.

The work of the past year furnishes a splendid record of self-sacrifice and unremitting labour. Undeterred alike by the threats of the anarchists or by the ill-natured and spiteful criticism which finds daily expression in the columns of the Bengali press, the officers of the department have continued the struggle against revolutionary crime with a courage and devotion which deserves the admiration and gratitude of all honest men. If ever the time arrives when a complete record can be published of the work of this

department since its inception it will be admitted that, in the European and Indian officers of the Intelligence Branch, Government has at its disposal a body of men second to none in loyalty, courage and devotion to duty.

We do not grudge the police this praise, which "the Governor in Council entirely endorses." Many men of the Department have certainly deserved it. But it is neither correct, nor dignified, nor statesmanlike, to characterise the criticism of the Bengali press as ill-natured and spiteful. The wearer alone knows where the shoe pinches. And the Bengali press represents those innocent people of Bengal who are inconvenienced by the Police shoe. Do His Excellency the Governor and members of his executive council know why the police are disliked and feared?

By the by, what has become of Mr. Gourlay's enquiry into the working of the police department? Did he submit any report? What was His Excellency's private secretary's verdict? If it was in favour of the police and if His Excellency has accepted it, the fact should be made known to the public. There is no reason why the high eulogy, if any, bestowed by Mr. Gourlay on the police should remain unpublished.

Government may also deign to consider why the Bengali press does not indulge in spiteful and ill-natured remarks on postmen, postmasters, munsifs, subordinate judges, deputy collectors, &c. Unquestionably a far larger number of persons have to deal and come into contact with these public servants than with policemen. The theory that we are spiteful can be supported only on the supposition that we are all would-be dacoits or criminals of that description, or are in sympathy with such persons, and we hate the police because they stand in the way of our or their giving effect to criminal intentions;—which is a highly complimentary hypothesis.

We know Government cannot do without the police. They are its eyes and hands. Let them be praised and rewarded. But why seek to stop our mouths? The only wise method of stopping criticism is to raise the efficiency and elevate the character of the police force. Any other method is unwise. Why are the London Police not criticised, though the highest ministers of the Crown in England are often subjected to abuse and virulent criticism by sections of the British press. Be-

cause the London Police are friends and servants of law-abiding citizens. Can the same thing be said of our police officials?

It should not be forgotten that improvement in the character and conduct of the police is due in no inconsiderable measure to criticism in the newspapers.

Emigration to Fiji.

We are glad to find that the assurance given by the Government of India during the viceroyalty of Lord Hardinge that the system of supplying indentured labour to Fiji would be abolished, has not allayed all the apprehensions of the leading Indians in Fiji. Those who profit by that system are wealthy, powerful and resourceful. They may yet succeed in getting a substitute for the indenture system which, while differing in name, would be the same in substance. One such system, that prevailing in the Federated Malay States, has already been proposed to be introduced; whereupon the leading Indians of Fiji have made a representation to Mr. E. Castaldi, Secretary to the Indian Immigration Committee, Suva, Fiji, which is dated July 15, 1916, a copy of which has been sent to us from that colony. It is printed below.

We have been made aware from newspaper reports, etc., of the questions that are exercising the mind of your committee regarding the future prosperity of this Colony, in which our countrymen are admittedly a most important factor.

2. As regards the proposal to substitute a system copied from the Federated Malay States, we beg most respectfully to submit that such a change would revive penalties similar to those already lately deleted from our existing indentured labour code. And the power that the employer would possess to place a labourer under arrest for real or imaginary impertinence or disobedience, etc., would lend itself to many abuses; also the power the magistrates would possess in the matter of the penalties for such offences might be abused. A glance at the March, April, and June, 1916, numbers of the "Indian Emigrant" published in Madras, would convince one that under this so-called free immigration there are great wrongs in the matter of the recommitment, stay at Depot, embarking and voyage.

3. In view of the foregoing we beg to suggest that the system outlined by Messrs. Andrews and Pearson in their admirable report deserves to be given the first place in your consideration.

4. We also submit that whatever system is finally decided upon, the code enacted concerning it must be translated into plain and intelligible Indian vernaculars, such as may be readily understood by intending emigrants, who should be each furnished with one copy of the tract gratis or at nominal cost.

5. Besides, we desire to recommend the necessity, from the point of view of improving labour conditions, in all parts of the world and in justice to the risk

undertaken in modern manufactures, or having some legislation similar to the Employers' Liability Act and the Workmen's Compensation Act prevalent in England.

In conclusion we beg to record our heartiest gratitude for the scheme agreed upon, to secure regular and frequent steamship communication between Fiji and India at nominal rates of passage, which is a boon to the Colony, and to the Indian people in particular, the magnitude of which boon, it is scarcely possible to realise fully at this stage but which we feel sure will be the means of developing this beautiful country by leaps and bounds.

We think it is indispensably necessary to have a non-official Indian Emigration Committee here, with a whole-time secretary, to study all questions relating thereto as they arise, and to promptly take all such steps as may be necessary. The balance of the funds raised for helping the South African Indians may be partly or wholly utilised for this purpose. "The Indian Colonial Society" founded and organised by Mr. T. K. Swaminathan, Editor of *The Indian Emigrant*, may be able to do the kind of work that we have in view, if it receives the support that it ought to.

The watchfulness of our leading countrymen in Fiji is praiseworthy, and will, we hope, be kept up.

Habitation for the Hindu University.

It is now a question of months for the Hindu University to begin its work of teaching and of advancement of learning. As it is expected to be a home of Hindu culture the style of the buildings in which it is to be housed should surely receive attention. We are not in favour of spending money extravagantly on edifices and having little or not much left for the real work of educational institutions. But some Indian style of architecture, or a harmonious and artistic combination of several, may easily be adopted; for an Indian style is not necessarily very expensive. Mr. O. C. Gangoly, Vice-president of the Indian Society of Oriental Art, Calcutta, draws attention to this point in a letter contributed to a recent number of the *Central Hindu College Magazine*.

University Endowments and Patronage.

A rumour has reached our ears that a certain wealthy person has promised to donate Rs.150,000 to the Hindu University on the condition that a certain gentleman, whom he has named, is to be appointed to fill the chair to be created with the income of the endowment. We need not

ascertain whether the rumour is true or not. Nor need we discuss the fitness of a particular donor to select a professor or the qualifications of a particular nominee. We shall briefly discuss the general principle.

It will be conceded that, speaking generally, the senate or board of appointment of a University is more competent to choose professors than individual donors, though there is no doubt, for particular subjects there may be a few persons here and there more competent to select professors than any member of senate or board. For this reason it is best that donors should only make endowments and mention the objects for which they are to be utilized, and leave the choice of lecturers, professors, &c., to the university. So far as a university is concerned, we think it might be derogatory for it to accept donations on any condition like the one mentioned above. Nor would it, we think, add to the dignity or usefulness of a professor to be nominated by a donor. It might appear as if the donation was being made to induce the university to accept a professor who might not otherwise be thought the most competent.

Indentured Labour.

In the course of the speech delivered by His Excellency the Viceroy at the meeting of the Imperial Legislative Council held on September 5 last, His Lordship made the following observations on the question of indentured emigration:—

One of the most important questions which is now occupying the attention of my Government and of the Provincial Governments whom we have addressed on the subject is that of a scheme to be substituted for indentured emigration, as it is sometimes described. This is perhaps hardly a correct way of putting it, as it implies that we are trying to work out a scheme for the purpose of supplying labour to the colonies whereas the scheme we are contemplating relates to a very different matter, viz., the control of the operations of persons so engaged. Labourers have a right to emigrate if they wish and it would be very unwise and very undesirable on our part to prevent them and we are therefore trying to devise arrangements which will secure that recruitment in this country is conducted under decent conditions, that a proper sex ratio will be maintained and that on arrival in the country of their destination they will be properly treated and allowed to engage themselves on terms at least as free as those obtaining at present in the Malay Peninsula where a labourer can leave his employer by giving a month's notice. These are the conditions which in our letter to the Local Governments we

explained are regarded by the Government of India as necessary for a satisfactory system of emigration. I think it will be clear to all who have studied the question that the Government of India would be departing gravely from its duty if it allowed emigrant labour to leave this country without proper protection and safeguards. There are a certain number of labourers, I believe a very small number, who emigrate as genuine free labourers, that is to say, unassisted by pecuniary help and uninvited by any interested agency. But if we confine ourselves to the abolition of our existing indentured emigration a position will arise in which the parties interested in procuring Indian labour will be free to induce labour to emigrate by pecuniary help under any conditions they like so long as the labourer does not go under indenture. The abuses likely to arise out of such a state of things would be very serious. I need only refer to the state of affairs which existed before the amendment of the Assam Labour and Emigration Act in connection with so-called free labour.

We do not think the Government of India are in a position to protect Indian laborers in British Colonies or foreign countries. Of course, emigration cannot and ought not to be entirely stopped. But whatever safeguards the Government of India may adopt, so long as Indians are not recognised in practice in their own country as "equal subjects of the king" and equal citizens of the British Empire, the lot of Indian labourers outside India cannot but approximate to that of slaves or semi-slaves. The only real and lasting remedy, therefore lies, (i) in the obtaining of Home Rule by Indians, so that they may be able to mete out to others the treatment they receive from them. The Colonists cannot treat us like men until and unless our political status is in fact, as it is in theory, exactly the same as theirs. (ii) The other line of development which will enable us to raise the status of our labourers is the industrial progress of the country, so that we may have a sufficient number of factories to absorb all the labour lying unemployed in India. There would not then be much inducement for the labouring class to go abroad in search of the means for a mere animal existence. Those who would venture abroad would be able to dictate their own terms. (iii) And this would be facilitated by universal education, which would so increase the fund of information of the masses and quicken their intelligence as to make it much more difficult than now for recruiting agents to deceive them.

The Viceroy speaks of maintaining a proper sex ratio. The very words used jar on our ears though His Excellency's intention was good. The coolies are human

beings. They are not cattle. So far as cattle are concerned, any male and any female may mate. But as regards human beings, there are religious, social, moral and caste reasons why such a state of things cannot be tolerated. In the case of married women, they should not be allowed to emigrate except with their husbands, and, if they have minor children, with these children also. Further details need not be entered into here. Suffice it to say that our human feelings and our national self-respect demand that in any steps that Government may take in this matter strict attention should be paid to family ties, social conventions and the rules of morality.

As regards His Excellency's reference to labor conditions in the Malay Peninsula the representation submitted by some leading Indians of Fiji, which is printed elsewhere, would go to show that there is no reason to think that the lot of Indian coolies in the Federated Malay States is all that can be desired.

The Bombay Chronicle writes as follows on the Viceroy's observations:—

His Excellency's reference to measures to be taken for regulating enemy trade after the war, and administrative measures consequential upon suggestions made in Council are satisfactory. We regret we cannot say the same of the Viceroy's frank statement as to the intentions of Government with regard to emigrant labour. As we understand the matter, the Government is engaged upon finding a substitute for the system of indentured labour. His Excellency says this is hardly a correct way of describing the attitude of Government. There is hardly much practical difference. Indentured labour was State-regulated, and what is proposed is a substitute of which the leading characteristic is to be "the control of the operations of the persons so engaged." Public opinion is decided on one point, and that is that there should be the freest emigration possible, that the labour should not be "engaged" in any sense contrary to the wishes and inclinations of the emigrants themselves, and that neither the Government here nor any Colonial authority, whether British or foreign, should have a hand in the regulation of Indian emigrant labour. What will be the effect of the action the Government of India contemplates? It will impose upon itself the double duty of regulating the conditions of recruitment here and the conditions of "labour elsewhere." The question is whether the Government will be able to devise machinery suitable for the performance of this double duty which will be even more onerous and vexatious outside India than it may be here. These, however, are points that may be reserved for further consideration. The transition from the system of indentured labour to regulated emigration and labour is not likely to be negotiated quite so easily as His Excellency imagines, and the proposals in this regard will have to be very carefully scrutinised and considered.

The Position of Indian Labourers in British Colonies.

Regarding the political status of Indian labourers who may choose to settle in a colony when the period of their indenture or contract is over, *The Bombay Chronicle* has some excellent remarks. Its extracts from the opinions of eminent British statesmen are particularly timely and valuable. Our contemporary says:—

We are far from being disposed to grant that the Government of India could undertake the regulation of recruitment here or the conditions of labour abroad without incurring a responsibility which may prove beyond its capacity. But even admitting this is possible, the further question remains whether the Government should stop here and not find a permanent solution of the problem on the lines indicated by older statesmen, like the late Lord Salisbury and Mr. Joseph Chamberlain, and even so recently as 1908, by Colonel Seely (then under-Secretary for the Colonies). These statesmen approached the consideration of the problem of Indian emigrant labour not exclusively from the point of view of regulation of recruitment or conditions of labour, but also from the other standpoint. It seems worthwhile drawing attention to the declarations of these statesmen. In 1875, the late Lord Salisbury, as Secretary of State for India, wrote to the Government of India:—

"Above all things we must confidently expect as an indispensable condition of the proposed arrangement that the colonial laws and their administration will be such that Indian settlers, who have completed the terms of service to which they agreed as the return for the expense of bringing them to the Colonies will be in all respects free men, with privileges no whit inferior to those of any other class of Her Majesty's subjects resident in the Colonies."

Had Lord Salisbury's warning been paid heed to, how much bitterness, racial antagonism and needless political conflict could have been avoided! What has made the problem seemingly so hard of solution was the neglect to keep in view the "indisputable condition" insisted upon by Lord Salisbury over forty years ago. Then, as up till very recently, the policy of patching without plan and without thought of the morrow has been in high favour. If the Government of India lost sight of the only sound policy in the matter, an Imperial statesman of the standing and authority of Mr. Joseph Chamberlain did not.

Our Bombay contemporary then proceeds to quote what the late Mr. Joseph Chamberlain said while addressing the Premiers of the self-governing colonies assembled at the first of the great Imperial Conferences:—

"We ask you also to bear in mind the traditions of the Empire, which makes no distinctions in favour of or against race or colour; and to exclude by the reason of their colour, or by the reason of their race, all Her Majesty's Indian subjects, or even all Asiatics, would be an act so offensive to these peoples that it could be most painful, I am quite certain, to Her

Majesty to have to sanction it.....The United Kingdom owns as its brightest and greatest dependency that enormous Empire of India, with 300,000,000 subjects, who are as loyal to the Crown as you are yourselves, and among them there are hundreds and thousands of men who are every whit as civilised as we are ourselves; who are, if that is anything, better born, in the sense that they have older traditions and older families who are men of wealth, men of cultivation, men of distinguished valour, men who have brought whole armies and placed them at the service of the queen, and have in times of great difficulty and trouble....saved the Empire by their loyalty. I say, you, who have seen all this cannot be willing to put upon those men a slight which I think is absolutely unnecessary for your purpose, and which would be calculated to provoke ill feeling, discontent, irritation, and would be most unpalatable to the feelings, not only of her Majesty the Queen, but of all her people."

These, says the Bombay paper, are "Noble words, inspired by the truest Imperial comprehension, not only of the necessity of employing Indian labour for the natural resources of sub-tropical regions, but of the 'indisputable condition' upon which alone that labour can be recruited and employed."

For reasons we need not pause to consider, Mr. Joseph Chamberlain's solemn warning was unheeded by the Premiers of the self-governing Colonies in 1897, as 22 years earlier Lord Salisbury's warning was unheeded by the Government of India itself. It is impossible, in the retrospect, to acquit the Government of India on the charge of continued neglect to safeguard the interests of Indian labour, and far transcending in importance any temporary material interests, their political interests. In any view of the matter, it was the primary duty of the Government of India to have kept constantly in its own view, and to have kept constantly in the view of the Imperial Cabinet, the joint responsibility of the Imperial and Colonial Governments with regard to Indian labour. Whatever might have been the attitude of the Government of India, the principles enunciated by Lord Salisbury and Mr. Joseph Chamberlain were never lost sight of in England, by statesmen, in or out of office, occupying front rank.

The Bombay Chronicle then pointedly calls attention to "the striking utterance of Colonel Seely in the House of Commons on July 31, 1908":

"If persons are admitted (into British Colonies) they must be given civil rights. 'Free or not at all' seems to be the soundest principle for the British Empire.....If any one is admitted under the British flag, he must be a potential citizen, and must, sooner or later, be given rights with all other men."

Our contemporary concludes its important observations with the following paragraph:

We have ventured to call attention to these utterances of responsible statesmen, for it seems to us above all things necessary that in any arrangements

that may be made, the conditions they have laid down should be insisted upon. We have re-read Lord Chelmsford's speech, and as his Excellency omits to make any reference to the rights and status of Indian labourers, it is necessary that his attention should be drawn to the omission. We know Lord Hardinge would have pressed this view: Lord Chelmsford can possibly do no less.

We are also certainly of opinion that no emigration of labour should any longer be allowed without seeing that the men and women going abroad receive the treatment and obtain the rights to which human beings and citizens of the British Empire are entitled.

Excellent principles have been so often enunciated and laid down by British sovereigns and statesmen in relation to India without their being followed in practice by those in actual charge of Indian affairs, that the mere formulation of a principle has long ceased to inspire any hope or enthusiasm. On the contrary it now often raises a cynical smile and the apprehension that the practice will be the exact opposite of the theory. Government ought to make the most strenuous efforts to put an end to such a state of things.

The Viceroy on Educational Development.

We cannot say that the Viceroy's pronouncement on educational development in his first council speech is likely to rouse enthusiasm.

He said:—

In the sphere of education the influence of the war has been very apparent. The Provincial Governments have, as the Council is aware, been forced by the financial situation to restrict their educational programmes and the Government of India for the same reason had been unable to assist them with increased grants. We have, however, brought under their consideration three classes of educational effort in which some progress may suitably be made when better times recur. We have in the first place consulted the Local Governments and the public on the lines which should be followed in the important matter of the development of female education, especially in its primary phases, one of the most important and most difficult of the problems which have to be faced in the near future and one which I could wish that we were better prepared to meet. We have also drawn attention to the claims on Government assistance possessed by institutions for the instruction of the blind and the deaf and dumb and lastly we have placed before the Provincial Governments the necessity of maintaining more systematic than at present for securing an adequate supply of properly trained teachers, perhaps the most vital requirements in our educational system to-day. Since we last met, moreover, two new Universities have come into existence—one at Benares and one at Mysore—and

much consideration has been given to the pending proposal for the institution of new Universities at certain other centres. The rules for the grant of scholarships in England have at the same time been consolidated and improved and we have had correspondence with the Secretary of State on certain aspects of the complaints which have from time to time been made regarding the facilities for Indian students in England. I was glad in connection with this question to be able lately to announce the constitution of a special delegation at Oxford and an intercollegiate Committee at Cambridge for the express purpose of meeting the needs of Indian students whose numbers at these two Universities are said to have trebled in the last ten years.

This does not raise any hope of any appreciable expansion or improvement in any direction, until "better times recur."

In this Review we have often said that there are things which can not brook any delay. Some of these are, feeding, medical treatment and education. The head of a household does not say to his hungry children: "Wait for your meals till better times come." Because by that time their souls might leave their bodies. So some sort of food has to be provided without delay. When the children fall ill, the parents do not say: "We will call in a doctor when we have some income;" for by that time some of the poor things may die or become invalids for life. When the little ones are old enough to begin learning the parents do not say: "We will send you to school next decade or the decade after next;" for by that time they may grow too old for learning, and so remain ignorant and inefficient throughout the whole course of their lives. *The most valuable assets of a nation are its children. It is the duty of the State to see that every one of them is properly fed, kept in good health and educated. A government which does not do this is guilty of neglecting one of its primary duties.* Generations of Indians have remained crippled for life for want of education.

The Viceroy's solicitude for the blind and the deaf and dumb is praiseworthy. But what about the millions of children who have eyes but are not enabled to see, have ears but have no opportunities to listen to what would truly make men of them, and have the power of speech but are not taught to speak as becomes free and enlightened human beings?

Trained teachers are very good things, but England and many other civilized countries have had schools with many

untrained teachers for generations, nay centuries. Even now there are many uncertificated teachers in England. The expansion of education ought not to wait for an adequate supply of certificated teachers. The two things should proceed *pari passu*. When there is famine and one has to feed a hungry populace, if expert cooks cannot be had in sufficient numbers, ordinary cooks are employed. There is knowledge-famine in India. If trained teachers cannot be had in abundance, untrained literate men and women who have some knowledge ought to be employed to teach classes according to their capacity.

As for the special delegation at Oxford and the inter-collegiate committee at Cambridge for Indian students, their constitution reminds us of the old dictum that presbyter was only priest writ large. These Oxford and Cambridge bodies are only the Indian Students' Department with changed names. It is not change of machinery that is needed; there should be a change of spirit. Why were there not a Colonial Students' Department? Why are there not delegations and inter-collegiate committees for colonial students? Our students are not babies, nor are they worse behaved than other classes of students. What we want is that large numbers of our students should have facilities, and better facilities, for education in the United Kingdom than at present. "Guardianship" and "supervision" are not required. These are rather looked upon with suspicion.

Report of the Public Services Commission.

The date of publication of the report of the Public Services Commission cannot make much substantial difference in the advantage or disadvantage which Indians may reap from its recommendations. What we are unable to understand is why at an earlier stage of the war the psychological moment for its publication was considered not to have come, and why now it is believed to have arrived. As to the anxiety said to be felt by some persons to avoid any controversy during the war, the less said the better.

We never expected any good to result from the labours of the Commission. Perhaps the additional disadvantage which would result to India from the publication of its report now, would be the possible use

that might be made of it in certain quarters to represent the demand for Home Rule as being not at all urgent. The recommendations of the Commission might be represented as a very great concession made to India, and it might be argued that Indians should first prove their fitness for these extraordinarily generous concessions before clamouring for more. Our political opponents are such past matters in exaggeration that they might even assert that Home Rule had for ever been made unnecessary and superfluous by the recommendations of the Commission!

Communal Representation in the U. P.

The position of the Hindus in the U. P. municipalities having been made quite satisfactory, to whom we need not say, attention has next to be bestowed on their position in the district boards. Musalmans abound in the towns and do not abound in the rural areas of those provinces; hence, quite logically, the Musalmans ought to have the same kind of position in both the municipalities and the district boards. Where the Musalman element is strong, well,—it ought to be stronger. Where it is not strong, well, should it not be made stronger? This is very much like the drinker's argument, which is in favour of your having a drop when you are hot, and also in favour of your having a drop when you feel cold.

We find that some Hindu candidates for municipal seats in some towns have withdrawn their candidature. This is undoubtedly a step in the right direction. It is certainly far better than quarrelling with our Musalman neighbours. The Hindu-Musalman problem, whatever its origin, is one on whose satisfactory solution the political progress of India depends to a very great extent. If the Hindus and the Musalmans were the only parties to it, its solution would not have been very difficult. But we have also to reckon with those men of British birth both here and in England who are opposed to our national solidarity and progress.

Collegiate Education in the U. P.

It is said the Benares Queen's College, which has a commodious building and an adequate staff, has only some 135 students, on its rolls, and still it refused admission to some 400 seekers of knowledge. What can be the reasons for thus shutting its

gates? Is the principal an absolute monarch, or is the director of public instruction an autocrat? The matter is of sufficient importance to be carried up to the highest authority in India and, if need be, in England. We are accustomed to the plea of want of money or of want of accommodation. But here is a case where money is spent and where there is plenty of accommodation; but there is some one, we do not know who, who says, "It is my will that no more boys should have collegiate education." It is the urgent duty of Government to find out this person and tell him that he is far too antiquated for the twentieth century, and unless he chooses to march with the times he must make room for a more progressive man.

Lord Carmichael's Successor.

It is rumoured that Sir Michael O'Dwyer is likely to succeed Lord Carmichael as Governor of Bengal. Governorships have been created, we suppose, on the principle that statesmen from England, with a fresh outlook, should come out to govern provinces; and that is a good principle. Members of the Civil Service have already acquired a monopoly of far too many offices. They ought not to be allowed to aspire to governorships. Independent Punjab opinion of Sir Michael is not at all favourable. He may have been able to crush disturbances with an iron hand *after* they had occurred and humiliated and ruined hundreds of persons belonging, for the most part, to a particular section of the community; but if the crushing be an argument in his favour, are not the previous unrest and wholesale raids and disturbances a much stronger argument against his capacity and statesmanship? Conditions here and in the Punjab are very different. Bengal certainly does not want a Sir Michael O'Dwyer.

Sir S. P. Sinha.

We frankly confess we are unable to solve the mystery of Sir S. P. Sinha's accepting a membership of the Bengal Executive Council in succession to Nawab Sir Syed Shams-ul-Huda. He had held a higher office before and resigned it of his own accord. The pecuniary sacrifice now to be made is much higher than that involved in his acceptance, years ago, of the office of Law Member of the Viceroy's Executive Council. There is no glory in being the successor of

the Nawab Sahib, as the latter's position in the Vakil Bar was not superior to Sir Sinha's position among Barristers. If by becoming a member of the Executive Council one could render signal service to the country, we could understand the meaning of an incumbent's sacrifice. But there is no such possibility of national service. If there were, why did Sir S. P. Sinha resign his much higher office with its higher possibility of serving the Motherland? Should Sir S. P. Sinha be able to complete the full period of 5 years' service, he would have to forego the acquisition of at least 10 lakhs of rupees. Should the service of the nation be his object, he could better render it by devoting this amount to the welfare of the country as a non-official.

There is, moreover, some disservice done to the country in a person of Sir Sinha's position accepting such office. It amounts to a practical admission that any Government post is good enough for any Indian. When Englishmen come out from England as High Court Judges or Chief Justices, or as Law Members, or as Commerce Members, they are pecuniarily gainers thereby, which shows that these Englishmen were not front rank men in their professions "at home." But when Indians are to be appointed, they must be front rank men, they must make heavy sacrifices; which means that race counts for much, not capacity as measured by the earning power, or position in one's profession. Really we do not appreciate the fun of asking an Indian to accept a salary which is one-fourth of his income, nor understand the mystery of his accepting the offer. Some men in England, no doubt, have to make great sacrifices in order to become cabinet ministers; but that is no parallel. Will Sir S. P. Sinha possess one-tenth of the power for good possessed by a cabinet minister?

Famine in Bankura.

Help continues to be given to the famine-stricken people of Bankura, and will have to be given for some weeks more, probably till the end of this month. In the coming cold season, the indigent will require clothes, and huts will also have to be repaired. Good use can still be made of contributions coming in.

Floods and the Cyclone.

Floods and the cyclone have done great damage in Bihar, the U. P. and

Bengal. The only redeeming feature is the efforts of public-spirited persons in all provinces, particularly of the student population, to relieve the sufferings of the inhabitants of the tracts affected. May our young men, when they grow older, have the tender, feeling hearts, and the strong active hands they now have.

Yellow Men as the Coming Race.

The September number of the *Japan Magazine* contains the following note with the heading "*Chance for Orientals*":—

CHANCE FOR ORIENTALS

The *Chiuwo* thinks the regime of the white races is waning, and the day of the yellow man is fast approaching. Though the white races have seized and held most of the choice places of the earth, they have not really possessed all of them, owing to their inability to endure the more tropical climates. Success, to be real and permanent, must be something more than commercial; the conqueror must be able to live and be healthy in his new possession, or he does not really own it. It is little consolation to be victorious politically if one is a failure physiologically. The regime of the white man will ultimately be limited to temperate zones. Outside of these he is like a fish out of water. In such places as North Australia, Egypt, Hongkong, Singapore, India, Penang, the white man is doomed, as well as in a large portion of South America. In all these places the white man will ultimately be obliged to give way to his darker brother, who can better endure the climate. Let the yellow races, therefore, realize before it is too late, the opportunity that awaits them; let them know their latent power and feel that their day is coming. It is not necessary forever to go on submitting to the white man and worshipping at his feet. There is no physiological foundation for his political and commercial superiority and present supremacy. Heaven has endowed the yellow man with the capacity, and given him the right, to live and prosper where the white man cannot exist.

This bit of writing is no doubt significant and has its lesson for Japan's allies and enemies. But is the yellow man only oriental? What is the place and what the future of the non-yellow oriental? Is he to be the slave of the yellow man?

Qualifications of Dependent Races.

The *Philippine Review* has the following about the character qualifications of dependent races:—

Is it now the most appropriate time to judge as to the character qualifications of the Filipino people? Or is it not rather too early and, therefore, unfair to judge them while they are still in a dependent state?

This is propounded because of the following alleged statement of Mr. Hendrick Colijn, Dutch ex-minister of war, who is said to have spent twenty years in the Orient:

"Filipino native government would be a failure, not because the natives lack education, but because they lack character."

We have to thank him for this acknowledgement of our cultural status.

Indeed, the fact that he (Mr. Colijn) spent fully twenty years in the Orient should have qualified him splendidly to judge orientals.

However, even granting that he acted in the best of faith, we doubt if he ever could have become, or can ever be, a good judge of orientals, specially if he, at no time, was ever really free from western prejudices against orientals.

Dependent peoples are always looked upon by westerners as short of qualifications; and, whatever their actual merits may be, they (their merits) are lost sight of under cover of such *advisably* prevailing belief that they (said people) are *short of qualifications*.

Their failures are magnified, and their successes minimized. Their failures are theirs, and their successes not theirs, and the latter are necessarily *the work of their masters*.

The mistakes of independent peoples are not mistakes to them; but the same mistakes, if made by dependent peoples even in the *minimum* degree, are considered *mistakes in the maximum degree*, deserving the most spiteful condemnation,—the result of their alleged lack of qualifications, character or what not.

Besides, dependent peoples are not in a position to act for themselves; for others act for them—those who, for one reason or another, in one way or another, have assumed responsibility for their tutelage—and are always discriminated against, and subject to the pleasure of their masters, whose vengeance must obtain.

On the other hand, an independent people are free from outside prejudices, none cares to waste time searching for their virtues and vices, and they are *per se* considered as fully qualified people, particularly if before and behind them big modern guns can deafeningly roar defensively and offensively.

"If America Sets the Example."

The same review has also the following note:—

"If America sets the example," says Mr. Colijn, "of giving independence to her Asiatic possessions, the nationalists in other European colonies would at once begin to chafe under their own restrictions, and there might be a good deal of trouble in more places than one."

As a distinguished Filipino has said, it is easy to copy what others have already done; what is really difficult is to make a new path.

Naturally, if it is desired to keep the so-called *European Colonies* in the East in a permanently unchanged state of ignorance and servitude, then it is to the interests of European colonizers to prevent America from going any further in her noble purposes with the Philippines.

However, America fought for her own freedom and for the liberation of slaves on her own soil, and cannot, for obvious reasons, follow the path of the others.

And if she sets the example, and sets it for the better, should it not, in the end, result in a greater good to mankind?

Exploitation of a people by a stronger people is but the application of the old theory of *gilded* that

has blocked the progress of dependent peoples. It has checked the proper development of dependent countries quite completely. For, on the one hand, the greed and energies of the dominant race are alone not enough to cope with the vitalities of the *conquered* soil; and, on the other, the abased spirit of the *enslaved* is hardly available for the task.

But free these countries, give them a chance to live their own way, and they will be better units of mankind, and their usefulness will be greater. For all will have the greatest of all inducement—the revered idea of their beloved country.

Then the world's wealth will be greater, a better, more unselfish feeling will prevail, and peace and friendship will be truer.

But the time will come when colonies will cease to be, when the *conquerors* themselves will find their situation untenable. For this is the work of education, the blessings of which are now eagerly sought for by the colonies themselves.

And education cannot be denied, and, however slow and loath the *masters* may be to give it, it has to be given. Otherwise, the people themselves will provide for it. And it is now no longer impossible so to do.

It is a cold fact, and Java itself shows no exception to this.

Bengalis and Soldiership.

Some of our Anglo-Indian journalistic patrons and destiny-makers have expressed the opinion that Bengalis never were soldiers. It is not at all necessary to convince these creatures that Bengalis were and can again be soldiers. It is necessary to convince only ourselves and our self-respecting and sane countrymen on the evidence of historical and contemporary facts that Bengal was and is not devoid of men possessed of physical strength and courage. These facts have been repeatedly mentioned in many journals including ours. Let that suffice.

If some Bengalis are now again going to fight, it is not at all due to the conversion of the Anglo-Indian journalistic arbiters of our destiny, but because of that necessity which rules the destinies of all empires and nations.

Bengal is not famous for its breeds of cattle and of sheep. The only lower animal which is its special product and to which it has given its name is the Royal Bengal Tiger. There is a village god, worshipped in Bengal, Dakkhin Ray, who has the tiger as his *vahan* "or conveyance." The climate, physical features, flora and fauna of Bengal have not prevented this animal from flourishing in its forests. We suppose, therefore, the material environment is not absolutely unfavorable to the birth and growth of soldiers in our province. Bengal can and does produce

men possessed of strength, agility and fearlessness, which are some of the characteristics of the Royal Bengal Tiger. One has to find them out and produce the mental and moral atmosphere which encourages manliness and impels men to become soldiers. Perhaps it is necessary also to destroy malaria and chronic semi-starvation.

Higher Commercial Education.

The question is as to whether we should have a college of commerce in Calcutta and whether the Calcutta University should have a degree in commerce, ought to be answered in the affirmative. Many modern Universities teach commerce and confer a degree in that subject. In India the University of Bombay has already followed in the wake of modern western Universities. Bengal is backward in commerce, and that makes the case for higher education in commerce all the stronger. From the days of Dwarakanath Tagore, Rangopal Ghosh, and others, some Bengalis have always shown their aptitude for mercantile business. There will, therefore, not be wanting a sufficient number of young intelligent Bengalis to avail themselves of commercial education. No doubt, commercial education is vocational education. But education in pedagogy, law, medicine and engineering is also bread-and-butter education. Therefore, there need not be any apprehension of loss of dignity on the part of the University in going in for commercial education. And the degree is required for giving those who have received a commercial training, the stamp of the University, so that they may have a status and market value equal to those of other graduates of the same standing.

It may be said that it is only experience which can make a *pukka* or perfect man of business. But does the University turn out skilled and expert teachers, lawyers, doctors and engineers? The followers of these professions become gradually skilled with growing experience. The colleges give only the preliminary knowledge and training. Such also would be the case with commercial education.

The courses for a commercial degree of some modern universities show that the subjects are such as would give sufficient intellectual training to entitle the

students to receive the hall mark of the university.

The subject of higher commercial education has been very convincingly dealt with in a memorandum prepared by Prof. M. Subedar and in a note written by Dr. Sarvadhikary, the present Vice-Chancellor of the Calcutta University.

Patna University Bill

We have not before us the full text of the speech delivered by Sir C. Sankaran Nair in introducing the Patna University Bill in the Imperial Legislative Council. From the brief reports published in two of the morning papers we learn that

The first senate and the syndicate will be constituted by the Act itself. The next and the ensuing senate will consist of not less than 10 and not more than 60 persons. The senate will include certain ex-officio Fellows, 4 Fellows elected by the faculties, 8 Fellows elected by certain classes of Fellows according to the regulations framed for that purpose. The senate is only to be a deliberative body. Its resolutions are not binding on the syndicate. The senate differs in this respect from the senate constituted under the Universities Act of 1904 which has the power of making regulations providing for the courses of study to be followed and the conditions to be complied with by candidates for the university examinations and also for the conditions to be complied with by schools desiring recognition for the purpose of sending up pupils for the matriculation examination. The ensuing syndicates will consist of 16 members some of them ex-officio. The Chancellor shall nominate 4 persons and 9 persons are to be elected by the senate. The syndicate will have control of all matters concerning education. Under the Indian Universities Act now in force the executive government of the University is vested in the syndicate while under the bill a full time vice-chancellor is to be the principal executive officer of the University. All matters relating to the administration of the University rules to regulate the admission of educational institutions to the privileges of the University and the withdrawal of such privileges, rules about the admission of students to the University and their examinations also will be provided for by the regulations. The first regulations are to be framed by the local Government. Such regulations may be modified and new additional regulations may be framed by the senate with the sanction of Government. No college will be affiliated without the consent of the syndicate, the senate and the local Government. As to disaffiliation on the other hand the local Government alone might do it after considering the opinion of the syndicate and the senate.

The constitution and powers of the senate are not satisfactory from the people's point of view. Nothing is said as to the proportion and number of the ex-officio fellows. Sixty is too small a number to represent the three provinces of Bihar, Orissa and Chota Nagpur. But as the

senate is only to be a deliberative body, whose resolutions are not to be binding on the syndicate, the small number of men whose time and energy are to be wasted in mere deliberation and speech-making, the better. The senate ought to have the power of initiative and of revising, altering and annulling what the syndicate may do. From the people's point of view there is no reason why the Patna senate should not have all the powers which the senates of the older Universities possess under the Universities Act of 1904. No necessity has arisen for out-Curzonizing the Curzonian Act.

We are not told how many members of the syndicate will be ex-officio. From the details furnished, it is to be feared that the syndicate will be an official-ridden body.

"No College will be affiliated without the consent of the syndicate, the senate, and the local Government. As to disaffiliation, on the other hand, the local Government alone might do it after considering the opinion of the syndicate and the senate." Or, in other words, the work and process of destroying existing colleges, when thought necessary, is to be a more summary and expeditious affair than the work and process of bringing new colleges into existence! This is typical of the attitude of the re-actionaries towards higher education. It is a pity that Sir Sankaran Nair has to pilot such a measure through.

The position of and courses of study in the existing colleges will be affected in the following way:—

The committee were of opinion that the Diamond Jubilee College at Monghyr under private management was a small and weak institution and the Government agreed with the committee that we would not be justified in spending the very considerable amount that would be required to equip and maintain it efficiently. It has not been therefore proposed to include it in the new university.

As to the courses of study it is intended that the university is to undertake the whole of the science teaching of the university colleges at Patna, law teaching, and the honours B. A. and the post-graduate work in arts subjects. Provision is to be made for a system of inter-collegiate lectures in the B. A. pass and so far as is possible in the junior classes at Patna, but the external colleges will teach arts subjects only up to the pass B. A. and to the Intermediate Science subjects. As exceptions to the above the Cuttack College will provide teaching for honours B. A. and the pass B. Sc. and the Bihar National College will provide teaching for the pass B. Sc.

So out of *only seven* arts and science colleges for a population of nearly 34½ millions, one is not to be included in the new university: which means that it will be extinguished. So the new university will begin, not with increasing the facilities for education, but the reverse. There will be a little diminution of facilities in another direction. At present St. Columba's College in Hazaribagh teaches the honours course in English for the B.A. degree. It seems it must cease to do so when the Patna University comes into existence. Why should not there be a fully equipped State College in the healthy sub-province of Chota Nagpur? Why should all post-graduate teaching be confined to Patna? We cannot say the Patna University is going to make Bihar, Orissa and Chota Nagpur educationally more advanced than they are at present.

It seems there is to be no engineering college, and no medical college. The spirit of modern civilization may be found in the other faculties of a university, but its body, without which it must be evanescent, has to be furnished by the faculty of engineering, in the shape of good buildings, roads, bridges, canals, drains, waterworks, railways, chemical, sugar, and other factories, engine workshops, mines, electrical power-houses and electrical lighting and other arrangements, &c. How is the province going to be modernised without engineers? No province in India turns out an adequate number of engineers to supply its own demands. From where is B.O.Ch. going to import her engineers? From outside India? But are they not too costly?

As for education in medicine and surgery, is B.O.Ch. a paradise where there are no diseases and untimely deaths? Patna University is not going to have a medical college,—a strange thing for a modern university in the twentieth century. No province turns out a sufficient number of doctors for its own needs. Where is the "new" province going to place its order for doctors?

"Indian Autonomy."

In reviewing Mrs. Besant's book "*India—a Nation*," *The Review of Reviews* writes:—

Mrs. Besant has recently thrown herself heart and soul into the movement to obtain Home Rule for India, for which purpose she founded some time

ago a league, an auxiliary branch of which has just been started in London. She presents, in her new book, a convincing argument for giving India self-government within the Empire. She says that India is poor and finds it hard to pay for the expensive administration that has been superimposed upon her, especially in view of the facts that the highest posts are monopolised by foreigners, Indian industries are not protected from ruinous competition, and the people are left illiterate. She maintains that the one way India can be made contented and prosperous is to let Indians work out their own destiny. Indians, in her opinion, are fully competent to govern themselves. Mrs. Besant would make the Presidencies and Provinces autonomous and incorporate them and the Indian States in a federation linked up with the British Empire. Her policy deserves sympathetic consideration.

The gifted writer converts the theory that Indians are a congeries of peoples, and establishes the connection between the political and religious movements of India—a connection frequently ignored. Pride in the Indian culture, she says, has infused a new life into Indians, and no development that is not along national lines can do permanent good to the people. Mrs. Besant pleads that if India is to be a source of strength to the Empire she must be allowed to express herself.

Rammohun the Nation-maker.

On the 27th of September, 1833, Raja Rammohun Roy breathed his last in Bristol. On the 27th of the last month his death anniversary was celebrated in many towns all over India. The full significance of his life and personality ought to be a matter for serious study to Indians.

It is now established that though the sciences are many, Science is one. Similarly, though there are many religions, Religion is one. In modern India, Raja Rammohun Roy was the first to realise this unity, not in theory alone, but in practice as well. In his age his was the most catholic heart and the most unprejudiced and clear-sighted spiritual vision.

The realisation of another unity first found concrete expression in his life. It is known that he was the pioneer, in the British period of Indian history, in the fields of religious, social, educational, political and economic reform and reconstruction. But what is much more necessary to understand and remember is that he reduced to practice his belief that *Reform is one* and that therefore the different kinds of reform are interdependent. His faith in the one God could not but lead him to believe that as Religion, Society, Politics, and Economics, all alike are governed by Him, no one can be a true reformer in one field who is opposed to reform in any other field.

Rammohun's gift to the nation, then, consists of the three Unities,—One God, One Religion, One Reform. The acceptance of his Monotheism in this comprehensive sense cannot but make his nation strong. This will be understood from our note on what Bagehot says on the national value of Monotheism.

The Press Deputation.

The Press Deputation, which is to wait upon the Viceroy ought to have included at least one Musalman representative, as the Musalman Press has suffered heavily from the working of the Press Act. But perhaps no Musalman journalist offered himself on account of the conditions imposed on the deputation.

The representation to be submitted to the Viceroy should be circulated among the members of the Press Association early enough to enable them to offer criticisms and suggestions for a final revision before submission.

Big Donation to Calcutta University.

MR. A. C. EDWARDS' GIFT OF RS. 2 LAKHS.

It is understood that Mr. A. C. Edwards, late of the Indian Educational Service and Officiating Principal of Presidency College, Calcutta, has made a donation of two lakhs of rupees to the Calcutta University.

Mr. Edwards in thus practically acknowledging what he and Great Britain owe to India has given proof of a liberal mind and has earned our sincere thanks.

Sanskrit in Japan.

In no land outside of India has Sanskrit been cultivated so long and nowhere is it now so widely taught as in Japan, says the "*Herald of Asia*." Exactly when it began to be studied, it is impossible to say. It may, however, be stated in a general way that it came to Japan with the religion of Buddha early in the 6th century. History tells us that about the middle of the 7th century there were a few Japanese priests studying Sanskrit at the Buddhist Translation Institute in China, under the well-known traveller and scholar Hsuen Tsang and his disciples.

But the serious and extensive study of Sanskrit among the Japanese dates from the arrival in Japan of two Indian Buddhists, Bodhisena and Fattriet, in the year

735. They had been staying in the capital of China for some time, when they fell in with the members of a periodical diplomatic mission from Japan, in whose train they crossed over to that country.

IMPETUS TO STUDY.

The presence of these Indians gave such impetus to the study of Sanskrit, that there began to rise a school of investigators some of whom rose to high positions in the Buddhist hierarchy not only of Japan but of China. It is, for instance, recorded in history that a Japanese priest named Reisen went to China in the retinue of Koko Daishi in 805, and being a competent Sanskrit scholar he was in course of time appointed Director of the Buddhist Translation Institute. In collaboration with an Indian priest, Prajna by name, he completed the translation of a Buddhist sutra which is known as Shinghi Kwangyo and still remains a standard work in its field. Reisen spent the rest of his life in China, honoured and respected by all sections of the community. He was by no means the only Japanese scholar of Sanskrit who worked and died in China. Several others did the same. One of these was Kongo, who, starting from China in 814, visited India, and after a short sojourn returned to China, doubtless laden with much valuable information.

Another Japanese visitor to India in those early days was no less a personage than Prince Takaoka, heir-apparent to the Emperor Saga. He was not, however, destined to go beyond Laos in Cochin-China, where, sad to relate, he fell ill and died with his devout scheme unfulfilled.

SANSKRIT MANUSCRIPTS.

Since the advent of Sanskrit in Japan down to the end of the Tokugawa period, an interval of about twelve hundred years, it is computed that that country produced more than three hundred Sanskrit scholars worthy of the name. They undoubtedly wrote much on Sanskrit grammar and other subjects. Much has, however, been lost through war and other causes, and about 150 volumes represent the whole amount of the fruits of their scholarship now extant. Besides, there have been preserved a large mass of Sanskrit manuscripts, documents, and tablets, originally brought from India direct, or through China. They are all of value as

specimens of Indian palaeography, while some are of still greater scientific importance.

Among those belonging to the latter category, are the famous palm leaf manuscripts of the Horyuji Temple, edited and published by Max Muller at Oxford, which are the oldest writings of the kind now extant in any country. Quite recently a palm leaf belonging to the same age (the 5th century) was discovered at the Chion-in, Kyoto. There are preserved other old materials of scarcely less importance at temples like the Horyuji, Kokiji and Kairyu-ji, in Yamato; the Midera and Saikyoji, in Omi; and those at Koyasan. The Japanese store of ancient Indian manuscripts and documents has recently been considerably augmented by the collections brought home by Dr. Junjiro Takakusu and Reverend Ekai Kawaguchi. All these materials are now being examined and studied under the supervision of Dr. Takakusu, the acknowledged doyen of Sanskrit scholars in Japan. The results of his labours, we learn, will be shortly given to the public.

SANSKRIT PROFESSORS.

The new era of learning ushered in by the Restoration of 1868, naturally revived interest in the study of Sanskrit. Recognizing the importance of the modern method of critical study, a number of promising young men have been sent to various European universities during the past forty years. As a result there is now in Japan a group of very able Sanskritists of European training. To mention some of them, there are Dr. Bunyu Nanjo, of the Higashi Hongwanji; Professor Dr. Junjiro Takakusu, Dr. Wogihara, and Professor Dr. Anesaki, of the Tokio Imperial University; Dr. Sakaki, of the

Kyoto Imperial University, Dr. Watanabe, of the Jodo Sect. Of these, Dr. Wogihara and Dr. Watanabe studied at Strasburg under Professor Leumann, while the others mostly studied at Oxford under Max Muller. Sanskrit is taught at the two Imperial Universities of Tokio and Kyoto and at seven of the colleges maintained by various denominations of Buddhism. The number of students now attending the Sanskrit classes at the Imperial Universities is about sixty altogether, while at the Buddhist institutions they are numbered by the hundred.

JAPAN AND INDIA.

The increased study of Sanskrit and Indian thought in Japan cannot fail to have far-reaching influence upon the mental and spiritual life of the Japanese. Through the difficult and complicated structure of Sanskrit they are introduced to a world of thought and feelings peculiarly congenial to their spirit; at every step of their hard won advance they recognize familiar shapes of old friends. All this shows how deep is their past spiritual indebtedness to India and how closely they are allied to the people of this country in all the essentials of inner life. The inevitable result of the increasing dissemination of a knowledge of Sanskrit among them ought to deepen the community of sentiment and sympathy between the peoples of India and Japan to their natural benefit.

We think our Sanskritists should open communication with Japanese Sanskritists, and fac-similes of all old Sanskrit manuscripts, documents and tablets should be obtained for our principal public, University and College libraries. The Hindu University should pay particular attention to this matter.

The Perfect Modernisation of Hair Oil IS KUNTAL-KAUMUDI TAILA

Highly adapted to Modern Brain, Mind and Hair. See what the mighty minds of modern age say—

Sir Rabindranath Tagore, "Poet-Laureate of Asia" —

"The ladies of my family frequently use KUNTAL KAUMUDI TAILA".

The Hon'ble Surendra Nath Banerji, the Gladstone of India :—

"KUNTAL KAUMUDI TAILA" is delightfully scented and refreshingly cooling. I Use it daily."

Price Per phial As. 12. Per V. P. P. Rs. 1-3-0.
3 phials Rs. 2. Per V. P. P. 2-11-0.

THE MODERN REVIEW.

JUST PUBLISHED, 461 Pages.

History of Aurangzib

Based on original Sources

by Jadunath Sarkar

Vol. III. Rs. 3-8.

First Half of the Reign, 1658-1682.

CONTENTS :

Members of royal family—High Officials—Foreign relations of India—Pro-Islamic and moral regulations—Sarmad beheaded—Shah Jahan's captivity and death—Conquest of Assam, Chatgaon, Palamau—Frontier Afghan wars—Repression of Hindus—Jaziya—Hindu risings : Jats, Satnamis—Growth of Sikh sect—Guru Govind's career—War with Rajputs—Raj Singh, Durgadas—Rebellion of Prince Akbar.

Works by Prof. JADUNATH SARKAR

History of Aurangzib.

2 vols, 730 pp., Rs. 3-8 each.

It is the only reliable and exhaustive history of India in the 17th century, being based upon original Persian sources, nearly all of which are in ms. and which no previous writer has used. In addition to the State papers of the Mogul empire and two Persian histories written by Hindus, the author has relied on more than 3,000 letters of Aurangzib and his contemporaries. All the Mass. available in the public libraries of Europe and India, besides several in private possession have been copied and utilised. Vol. I. is a detailed account of half of the reign of Shah Jahan and describes Aurangzib's system of provincial government and his diplomatic and military preparations. Vol. II. is an exhaustive and original account of the War of Succession between Aurangzib and his brothers.

Anecdotes of Aurangzib and Historical Essays.

248 pp. Re. 1-8.

CONTENTS : Life of Aurangzib (31 pp.),—Who built the Taj?—The Companion of an Empress (the life of a cultured Persian lady in the service of Shah Jahan),—The Wealth

of Ind in 1650,—Daily Life of Shah Jahan,—and of Aurangzib,—A Muslim Heroine (a woman who ruled the Afghans from 1677 to 1698),—Peringi Pirates of Chatgaon, (1660—Mogul conquest of Chatgaon),—Khuda Bakhsh (the founder of the celebrated library of Arabic and Persian Mss.)

"All the essays are brightly written, and several contain information not hitherto available to the English student." *Indian Antiquary.*

Chaitanya's Pilgrimages and Teachings.

338 pp., Rs. 2.

This is the only English translation of his contemporary biography, the *Chaitanya-charitamrita*; Madhya-lila. Readers ignorant of Bengali can here find the most correct account of Chaitanya's wanderings and preachings, his characteristic deed and sayings, exactly as known to his personal disciples. It incidentally describes the Hindu society of 1500 A. D. With a rare old portrait of the saint.

C. F. Andrews.—"The translation is lucid, clear and simple, and the book is remarkably well printed.....Gives the clearest picture of the Saint and his teaching, and is full of intense human interest from beginning to end."

Economics of British India.

3rd. Ed. thoroughly revised and enlarged,

pp. 336, Price Rs. 3.

This book gives, in one volume of manageable size, a complete account of India's physical features, economic products and resources, industries, transport facilities, currency, public finance, labour, laws, land tenure systems and legislation, etc.

Sir Theodore Morison—An authoritative work on Indian economics can only be written by an Indian. The author of the present book appears to possess the further essential qualifications of courage and independence. "Most useful publication..... simply invaluable to the student of Indian economics and public questions." *Mahratta.* "Extremely useful hand-book of valuable information." *Hindu* "An indispensable vade mecum." *The Modern Review.*

MY REMINISCENCES

BY RABINDRANATH TAGORE.

[ALL RIGHTS RESERVED.]

35 *Rajendra Lala Mitra.*

IT was about this time that my brother Jyotirindra had the idea of founding a Literary Academy by bringing together all the men of letters of repute. To compile authoritative technical terms for the Bengali language and in other ways to assist in its growth was to be its object—therein differing but little from the lines on which the modern *Sahitya Parisat*, Academy of Literature, has taken shape.

Dr. Rajendra Lala Mitra took up the idea of this Academy with enthusiasm, and he was eventually its president for the short time it lasted. When I went to invite Pandit Vidyasagar to join it, he gave a hearing to my explanation of its objects and the names of the proposed members and then said: "My advice to you is to leave us out—you will never accomplish anything with big-wigs; they can never be got to agree with one another," with which he refused to come in. Bankim Babu became a member, but I cannot say that he took much interest in the work.

To be plain, so long as this Academy lived, Rajendra Lala Mitra did everything singlehanded. We began with Geographical terms. The draft list was made out by Dr. Rajendra Lala himself and was printed and circulated for the suggestions of the members. We had also an idea of transliterating in Bengali the name of each foreign country as pronounced by itself.

Pandit Vidyasagar's prophecy was fulfilled. It did not prove possible to get the big-wigs to do anything. And the academy withered away shortly after sprouting. But Rajendra Lala Mitra was an all-round expert and was an academy

in himself. My labours in this cause were more than repaid by the privilege of his acquaintance. I have met many Bengali men of letters in my time, but none who left the impression of such brilliance.

I used to go and see him in the office of the Court of Wards in Maniktala. I would go in the mornings and always find him busy with his studies, and with the inconsiderateness of youth I felt no hesitation in disturbing him. But I have never seen him the least bit put out on that account. As soon as he saw me he would put aside his work and begin to talk to me. It is a matter of common knowledge that he was somewhat hard of hearing, so he hardly ever gave me occasion to put him any question. He would take up some broad subject and talk away upon it, and it was the attraction of these discourses which drew me there. Converse with no other person ever gave me such a wealth of suggestive ideas on so many different subjects. I would listen enraptured.

I think he was a member of the Text-book Committee and every book he received for approval, he read through and annotated in pencil. On some occasions he would select one of these books for the text of a discourse on the construction of the Bengali Language in particular or Philology in general, which were of the greatest benefit to me. There were few subjects which he had not studied and anything he had studied he could clearly expound.

If we had not relied on the other members of the academy we had tried to found, but left everything to Dr. Rajendra Lala, the present *Sahitya Parisat* would have doubtless found the matters it is now occupied

with left in a much more advanced state by that one man alone.

Dr. Rajendra Lala Mitra was not only a profound scholar, but he had likewise a striking personality which shone through his features. Full of fire as he was in his public life, he could also unbend graciously so as to talk on the most difficult subjects to a stripling like myself without any trace of a patronising tone. I even took advantage of his condescension to the extent of getting a contribution, *Yama's Dog*, from him for the *Bharati*. There were other great contemporaries of his with whom I would not have ventured to take such liberties, nor would I have met with the like response if I had.

And yet when he was on the war-path his opponents on the Municipal Corporation or the Senate of the University were mortally afraid of him. In those days Kristo Das Pal was the tactful politician, and Rajendra Lala Mitra the valiant fighter.

For the purpose of the Asiatic Society's publications and researches, he had to employ a number of Sanskrit Pandits to do the mechanical work for him. I remember how this gave certain envious and mean-minded detractors the opportunity of saying that everything was really done by these Pandits, while Rajendra Lala fraudulently appropriated all the credit. Even today we very often find the tools arrogating to themselves the lion's share of the achievement, imagining the wielder to be a mere ornamental figure-head. If the poor pen had a mind it would as certainly have bemoaned the unfairness of its getting all the stain and the writer all the glory.

It is curious that this extraordinary man should have got no recognition from his countrymen even after his death. One of the reasons may be that the national mourning for Vidyasagar, whose death followed shortly after, left no room for a recognition of the other bereavement. Another reason may be that, his main contributions being outside the pale of Bengali literature, he had been unable to reach the heart of the people.

(36) Karwar.

Our Sudder Street party next transferred itself to Karwar on the west sea-coast. Karwar is the head-quarters of the Kanara district in the southern portion of the Bombay presidency. It is the tract of

the Malaya Hills of Sanscrit literature where grow the cardamum creeper and the sandal tree. My second brother was then Judge there.

The little harbour ringed round with hills is so secluded that it has nothing of the aspect of a port about it. Its crescent shaped beach throws out its arms to the shoreless open sea like the very image of an eager striving to embrace the infinite. The edge of the broad sandy beach is fringed with a forest of casuarinas broken at one end by the *Kalanadi* river which here flows into the sea after passing through a gorge flanked by rows of hills on either side.

I remember how one moonlit evening we went up this river in a little boat. We stopped at one of Sivaji's old hill forts, and stepping ashore found our way into the clean-swept little yard of a peasant's home. We sat on a spot where the moonbeams fell glancing off the outer enclosure, and there dined off the eatables we had brought with us. On our way back we let the boat glide down the river. The night brooded over the motionless hills and forests, and on the silent flowing stream of this little Kalanadi, throwing over all its moonlight spell. It took us a good long time to reach the mouth of the river, so, instead of returning by sea, we got off the boat there and walked back home over the sands of the beach. It was then far into the night, the sea was without a ripple, even the ever-troubled murmur of the casuarinas was at rest. The shadow of the fringe of trees along the vast expanse of sand hung motionless along its border, and the ring of blue-grey hills around the horizon slept calmly beneath the sky.

Through the deep silence of this illimitable whiteness we few human creatures walked along with our shadows, without a word. When we reached home my sleep had lost itself in something still deeper. The poem which I then wrote is inextricably mingled with that night on the distant seashore. I do not know how it will appeal to the reader apart from the memories with which it is entwined. This doubt led to its being left out of Mohit Babu's edition of my works. I trust that a place given to it among my reminiscences may not be deemed unfitting.

Let me sink down, losing myself in the depth of
midnight.
Let the earth leave her hold of me, let her free me
from her obstacle of dust.

Keep your watch from afar, O stars, drunk though
 you be with moonlight,
 and let the horizon hold its wings still around me.
 Let there be no song, no word, no sound, no touch
 nor sleep, nor awakement,—
 but only the moonlight like a swoon of ecstasy over
 the sky and my being.
 The world seems to me like a ship with its countless
 pilgrims,
 Vanishing in the far-away blue of the sky, its sailors'
 song becoming fainter and fainter in the air,
 While I sink in the bosom of the endless night,
 fading away from myself, dwindling into a poem.

It is necessary to remark here that merely because something has been written when feelings were brimming over, it is not therefore necessarily good. Such is rather a time when the interference is thick with emotion. Just as it does not do to have the writer entirely removed from the feeling to which he is giving expression, so also it does not conduce to the truest poetry to have him too close to it. Memory is the brush which can best lay on the true poetic colour. Nearness has too much of the compelling about it and the imagination is not sufficiently free unless it can get away from its influence. Not only in poetry, but in all art, the mind of the artist must attain a certain degree of aloofness—the creator within man must be allowed the sole control. If the subject matter gets the better of the creation, the result is a mere replica of the event, not a reflection of it through the artist's mind.

(37) *Nature's Revenge.*

Here in Karwar I wrote the *Prakritir Pratishodha*, *Nature's Revenge*, a dramatic poem. The Hero was a sanyasi (hermit) who had been striving to gain a victory over nature by cutting away the bonds of all desires and affections and thus to arrive at a true and profound knowledge of Self. A little girl, however, brought him back from his communion with the infinite to the world and into the bondage of human affection. On so coming back the sanyasi realised that the great is to be found in the small, the infinite within the bounds of form, and the eternal freedom of the soul in love. It is only in the light of love that all limits are merged in the limitless.

The sea beach of Karwar is certainly a fit place in which to realise that the beauty of Nature is not a mirage of the imagination, but reflects the joy of the infinite and thus draws us to lose ourselves in it. Where the universe is expressing itself in

the magic of its laws it may not be strange if we miss its infinitude, but where the heart gets into immediate touch with immensity in the beauty of the meanest of things, is any room left for agreement?

Nature took the sanyasi to the presence of the infinite enthroned on the finite, by the path-way of the heart. In the *Nature's Revenge* there were shown on the one side the wayfarers and the villagers, content with their home-made triviality and unconscious of anything beyond; and on the other the Sanyasi busy casting away his all, and himself, into the self-evolved infinite of his imagination. When love bridged the gulf between the two and the hermit and the house-holder met, the seeming triviality of the finite and the seeming emptiness of the infinite alike disappeared.

This was to put in a slightly different form the story of my own experience of the entrancing ray of light which found its way into the depths of the cave into which I had retired away from all touch with the outer world and made me more fully one with nature again. This *Nature's Revenge* may be looked upon as an introduction to the whole of my future literary work; or rather this has been the subject on which all my writings have dwelt,—the joy of attaining the infinite within the finite.

On our way back from Karwar I wrote some songs for the *Nature's Revenge* on board ship; the first one filled me with a great gladness as I sang and wrote it sitting on the deck.

Mother, leave your darling boy to us,
 And let us take him to the field where we graze
 our cattle.*

The sun has risen, the buds have opened,
 the cowherd boys are going to the pasture;
 and they would not have the sun-light,
 the flowers and their play in the grazing
 grounds empty. They want their *Shyam*
 (Krishna) to be with them there, in the
 midst of all these, they want to see the

* This is addressed to Yashoda, mother of Krishna, by his playmates. Yashoda would dress up her darling every morning in his yellow garment with a peacock plume in his hair. But it came to the point she was nervous about allowing him, young as he was, to join the other cowherd boys at the pasturage. So it often required a great deal of persuasion before they would be allowed to take charge of him. This is part of the Vaishnava parable of the child aspect of Krishna's play with the world.
 —Tr.

Infinite in all its carefully adorned loveliness; they have turned out so early because they want to join in its gladsome play, in the midst of these woods and fields—not to admire from a distance, nor in the majesty of power. Their equipment is of the slightest. A simple yellow garment and a garland of wild flowers are all the ornaments they require. For where joy reigns on every side, to hunt for it ardently, or amidst pomp and circumstance, is to lose it.

Shortly after my return from Karwar, I was married. I was then 22 years of age.

(38) *Pictures and Songs.*

Chhabi O Gan, *Pictures and Songs*, was the title of a book of poems most of which were written at this time.

We were then living in a house with a garden in Lower Circular Road. Adjoining it on the South was a large Busti.* I would often sit near a window and watch the sights of this populous little settlement. I loved to see them at their work and play and rest, and in their multifarious goings and comings. To me it was all like a living story.

A faculty of many-sightedness possessed me at this time. Each little separate picture I ringed round with the light of my imagination and the joy of my heart, every one of them, moreover, being variously coloured by a pathos of their own. The pleasure of thus separately making off each picture was much the same as that of painting it, both being the outcome of the desire to see with the mind what the eye sees and with the eye what the mind imagines. Had I been a painter with the brush I would doubtless have tried to keep permanent record of the visions and creations of that period when my mind was so alertly responsive. But that instrument was not available to me. What I had were only words and rhythms, and even with these I had not yet learnt to draw firm strokes, and the colours went beyond the margins. Still, like young

folk with their first paint-box, I spent the livelong day painting away with the many-coloured fancies of my new-born youth. If these pictures are now viewed in the lights of that twenty-second year of my life, some features may be discerned even through their crude drawing and blurred colouring.

I have said that the first book of my literary life came to an end with the *Morning Songs*. The same subject was then continued under a different rendering. Many a page at the outset of this book, I am sure, is of no value. In the process of making a new beginning, much in the way of superfluous preliminary has to be gone through. Had these been leaves of trees they would have duly dropped off. Unfortunately leaves of books continue to stick fast even when they are no longer wanted. The feature of these poems was the closeness of attention devoted even to trifling things. *Pictures and Songs* seized every opportunity of giving value to these by colouring them with feelings straight from the heart. Or, rather, that was not it. When the string of the mind is properly attuned to the universe, then at each point the universal song can awaken its sympathetic vibrations. It was because of this music roused within, that nothing then felt trivial to the writer. Whatever my eyes fell upon found a response within me. Like children who can play with sand, or stones or shells, or whatever they can get,—for the spirit of play is within them,—so also we, when filled with the song of youth, become aware that the harp of the universe has its variously tuned strings everywhere stretched, and as the nearest may serve as well as any other for our accompaniment, there is no need to seek afar.

(39) *An intervening period.*

Between the *Pictures and Songs* and the *Sharps and Flats*, a child's magazine called the *Balaka* sprang up and ended its brief days like an annual plant. My second sister-in-law felt the want of an illustrated magazine for children. Her idea was that the young people of the family would contribute to it; but as she felt that that alone would not be enough, she took up the editorship herself and asked me to help with contributions. After one or two numbers of the *Balaka* had come out I happened to go on a visit to Rajnarayan Babu at Deoghar. On the return journey the train was crowded and as there was an unshad-

* A Busti is an area thickly packed with shabby tiled huts with narrow pathways running through, and connecting it with the main street. These are inhabited by domestic servants, the poorer class of artisans and the like. Such settlements were formerly scattered throughout the town even in the best localities, but are now gradually disappearing from the latter. —Tr.

ed light just over the only berth I could get, I could not sleep. I thought I might as well take this opportunity of thinking out a story for the *Balaka*. In spite of my efforts to get hold of the story it eluded me, but sleep came to the rescue instead. I saw in a dream the stone steps of a temple stained with the blood of victims of the sacrifice; a little girl standing there with her father asking him in piteous accents: "Father, what is this, why all this blood?" and the father inwardly moved trying with a show of grimness to quiet her questioning. As I awoke I felt I had got my story. I have many more such dream-given stories and other writings as well. This dream episode I worked into the annals of King Gobinda Mamkya of Tipperah and made out of it a little serial story, *Rajarshi*, for the *Balaka*.

Those were days of utter freedom from care. Nothing in particular seemed to be anxious to express itself through my life or writings. I had not yet joined the throng of travellers on the path of life, but was a mere spectator from my road-side window. Many a person hied by on many an errand as I gazed on, and every now and then Spring or Autumn, or the Rains would enter unasked and stay with me for a while.

But I had not only to do with the seasons; there were men of all kinds of curious types who, floating about like boats adrift from their anchorage, occasionally invaded my little room. Some of them sought to further their own ends, at the cost of my inexperience, with many an extraordinary device. But they need not have taken any extraordinary pains to get the better of me. I was then entirely unsophisticated, my own wants were few, and I was not at all clever in distinguishing between good and bad faith. I have often gone on imagining that I was assisting with their school fees students to whom fees were as superfluous as their unread books.

Once a long-haired youth brought me a letter from an imaginary sister in which she asked to take under my protection this brother of hers who was suffering from the tyranny of a step-mother as imaginary as herself. The brother was not imaginary, that was evident enough. But his sister's letter was as unnecessary for me as expert marksmanship to bring down a bird which cannot fly.

Another young fellow came and informed me that he was studying for the B. A., but could not go up for his examination as he was afflicted with some brain trouble. I felt concerned, but being far from proficient in medical science, or in any other science, I was at a loss what advice to give him. But he went on to explain that he had seen in a dream that my wife had been his mother in a former birth, and that if he could but drink some water which has touched her feet he would get cured. "Perhaps you don't believe in such things," he concluded with a smile. My belief, I said, did not matter, but if he thought he could get cured he was welcome, with which I procured him a phial of water which was supposed to have touched my wife's feet. He felt immensely better, he said. In the natural course of evolution from water he came to solid food; then he took up his quarters in a corner of my room and began to hold smoking parties with his friends, till I had to take refuge in flight from the smoke-laden room. He gradually proved beyond doubt that his brain might have been diseased, but it certainly was not weak.

After this experience it took no end of proof before I could bring myself to put my trust in children of previous births. My reputation must have spread, for I next received a letter from a daughter. Here, however, I gently but firmly drew the line.

All this time my friendship with Babu Srish Chandra Mazumdar ripened apace. Every evening he and Priya Babu would come to this little room of mine and we would discuss literature and music far into the night. Sometimes a whole day would be spent in the same way. The fact is my self had not yet been moulded and nourished into a strong and definite personality and so my life drifted along, light and easy, like an autumn cloud.

(40) Bankim Chandra.

This was the time when my acquaintance with Bankim Babu began. My first sight of him was a matter of long ago. The old students of Calcutta University had then started an annual reunion, of which Babu Chandranath Basu was the leading spirit. Perhaps he entertained a hope that at some future time I might acquire the right to be one of them; anyhow I was asked to read a poem on the occasion.

Chandranath Babu was then quite a young man. I remember he had translated some martial German poem into English which he proposed to recite himself on the day and came to rehearse it to us, full of enthusiasm. That a warrior poet's ode to his beloved sword should at one time have been his favourite poem will convince the reader that even Chandranath Babu was once young and moreover those times were indeed peculiar.

While wandering about in the crush, at the Student's Reunion, I suddenly came across a figure which at once struck me as distinguished beyond that of all the others, and who could not have possibly been lost in any crowd. The features of that tall fair personage shone with such a striking radiance that I could not contain my curiosity about him,—he was the only one there whose name I felt concerned to know that day. When I learnt he was Bankim Babu, I marvelled all the more. It seemed to me such a wonderful coincidence that his appearance should be as distinguished as his writings. His sharp aquiline nose, his compressed lips, and his keen glance, all betokened immense power. With his arms folded across his breast he seemed to walk as one apart, towering above the ordinary throng—this is what struck me most about him. Not only that he looked an intellectual giant, but he had on his forehead the mark of a true prince among men.

One little incident which occurred at this gathering remains indelibly impressed on my mind. In one of the rooms a Pandit was reciting some Sanskrit verses of his own composition and explaining them in Bengali to the audience. One of the allusions was not exactly coarse, but somewhat vulgar. As the Pandit was proceeding to expound this, Bankim Babu covering his face with his hands hurried out of the room. I was near the door and can still see before me that shrinking, retreating figure.

After that I had a longing to see him, but could not get an opportunity. At last one day, when he was Deputy Magistrate of Howrah, I made bold to call on him. We met, and I tried my best to make conversation. But I somehow felt greatly abashed while returning home, as if I had acted like a new and bumptious youth in thus thrusting myself upon him unasked or uninvited.

Shortly after, as I added to my years, I attained a place as the youngest of the literary men of the time: but what was to be my position in order of merit was not even then settled. The little reputation I had acquired was mixed with plenty of doubt and not a little condescension. It was then the fashion in Bengal to assign to each man of letters a place in comparison with a supposed compeer in the West. Thus one was the Byron of Bengal, another the Emerson, and so forth. I began to be styled by some the Bengal Shelley. This was insulting to Shelley and only likely to get me laughed at.

My recognised cognomen was the *Lisping Poet*.

My attainments were few, my knowledge of life meagre, and both in my poetry and my prose the sentiment exceeded the substance. So that there was nothing there on which any one could have based his praise with any degree of confidence. My dress and behaviour were of the same anomalous description. I wore my hair long and indulged probably in an ultra-poetical refinement of manner. In a word I was eccentric and could not fit myself into everyday life like the ordinary man.

At this time Babu Akshay Sarkar had started his monthly review the *Nabajiban*, New Life, to which I used occasionally to contribute. Bankim Babu had just closed the chapter of his Editorship of the *Bangadarsan*, The Mirror of Bengal, and was busy with religious discussions, for which purpose he had started the monthly *Prachar*, The Preacher. To this also I contributed a song or two and an effusive appreciation of Vaishnava lyrics.

From now I began to meet Bankim Babu constantly. He was then living in Bhabani Dutt's Street. I used to visit him frequently it is true, but there was not much conversation. I was then of the age to listen, not to talk. I fervently wished we could warm up into some discussion, but my diffidence got the better of my conversational powers. Some days Sanjib Babu, one of Bankim's brothers, would be there reclining on his bolster. The sight would gladden me, for he was a genial soul. He delighted in talking and it was a delight to listen to his talk. Those who have read his prose writings must have noticed how gaily and airily it flows on like the sprightliest of conversation. Very few have this gift of

conversation and fewer still the art of translating it into writing.

This was the time when Pandit Sashadhar rose into prominence. Of him I first heard from Bankim Babu. If I remember right Bankim Babu was also responsible for introducing him to the public. The curious attempt made by Hindu orthodoxy to revive its prestige with the help of Western science soon spread all over the country. Theosophy for some time previously had been preparing the ground for such a movement. Not that Bankim Babu ever thoroughly identified himself with this cult. No shadow of Sashadhar was cast on his exposition of Hinduism as it found expression in the *Prachin*—that was impossible.

I was then coming out of the seclusion of my corner, as my contribution to these

controversies will show. Some of these were satirical verses, some farcical plays, others letters to newspapers. I thus came down into the arena from the regions of sentiment and began to spar in right earnest.

In the heat of the fight I happened to fall foul of Bankim Babu. The history of this remains recorded in the *Prachin* and *Bharati* of those days and need not be repeated here. At the close of this period of antagonism Bankim Babu wrote me a letter which I have unfortunately lost. Had it been here, the reader would have seen with what consummate generosity Bankim Babu had taken the sting out of that unfortunate episode.

Translated by

SURENDRANATH TAGORE.

THE IMMEMORIAL CONCERT OF ASIA

BY PROF. BENOKUMAR SARKAR, M.A.

AN idea of Asiatic Unity is evident from the Japanese word *San-goku*, which is a common term embracing the three peoples,—the Chinese, the Hindus, the Japanese. Such a phrase as “so and so is *San-goku* ichi, i. e., the first in the three regions” is very common in Japan. It indicates the consciousness of a common standard of merit and efficiency as governing the three peoples. *San-goku* may be thus taken to be the Asiatic equivalent of what in modern times is known as the “Concert of Europe.”

(a) THE WORLD-TOURISTS OF MIDDLE-AGE ASIA.

We may look upon Hiuen Tshang as the great embodiment of the idea of the concert of Asia. The six hundred years that had elapsed between Mingti's dream and this Chinese scholar-saint's pilgrimage to India had led up to this conception which on Japanese soil became crystallised as *San-goku*.

The period of so-called anarchy in China was a great period in her religious history, both Taoist and Confucian as well as

Buddhist. It was marked also by the travels of Kumarajiva the Indian and Fa-hien the Chinese. The consciousness of a common world of life and thought was greatly promoted by the journeyings to and fro of men like these. The number of such travellers during the four centuries was not insignificant. The following list is taken from Beal's account in his *Buddhist Literature in China* compiled from Chinese sources.

Wei Dynasty (A. D. 220-60)

(1) Dharmakala, an Indian. (2) Kong-Sang-Kaj, a man of India. (3) Tant-ti, a Parthian. (4) Pih-yen, a man of the Western countries (India). (5) An-fa-hien.

Wu Dynasty (A. D. 222-64)

(1) Chi-hien, a Hun. (2) Wei-chi-lan, an Indian. (3) Chu-liu-yen, a fellow-traveller of the last. (4) Kong-sang-ui, a man of Samarcand. (5) Chi-Kiang, a man of the west.

Western Tsin Dynasty (A. D. 265-313)

(1) Dharmaraksha, a Hun. (2) Kiang-liang-lu-chi, a man of the west. (3) An fa-Kin, a Parthian. (4) Won-lo-yan-che, a man of Khoten. (5) Chu-shuh-lan, a man of the west. (6) Pih-fa-tsu of Kong-niu (Within the River). (7) Chi-fa-to. (8) Shih-tao-chi. (9) Fa-lih.

Eastern Tsin (Capital Kien Kang)

(1) Pi-si-li-mih-to-lo (Srimitra), a man of the western countries. (2) Chi-to-lin. (3) Chu-tan-won-lan (Dharmananda), a man of the western world. (4) Kiu-tan-sang-kia-ti-po (Gotamasangha Deva) a man of Cophene (Kabul). (5) Kia-lan-to-kia (Kaludaka) a man of the west. (6) Kang-tao. (7) Fo-to-po-to-lo (Buddhabhadra), a man of Kapilavastu and a descendant of Amritodana Raja (the uncle of Sakya-muni). (8) Tan-ma pi. (9) Pi-mo lo-cha (Vimalaksha), a man of Cophene. (10) Fa-hien. (11) Chi-ma-to, a western man. (12) Nanda, a man of the west. (13) Chu-fa-lih, a man of the west. (14) Kao-Kung. (15) Shih-lang-kung. (16) Shih-fa-yung. (17) Tan mo chi. (18) Shih hwei-shang. (19) Kiu-mo-lo-fo-te (Kumara-bodhi), a western man. (20) Sang-kia-po-ching, a Cophene (Kabul) man. (21) Tan-mo-ping, an Indian. (22) Dharmananda, a Turk (?).

Yaou Tsin Peri (Capital Changan)

(1) Chu-fo-nien. (2) Tan-mo-ye-she (Dharmayasas), a Cophene man. (3) Kum-trajiva, originally a man of India but afterwards of Karashar. (4) Fo-to-ye-she, a Cophene man. (5) Fo-ye-to-lo (Punvatar), a Cophene man. (6) Pakin. (7) Shih-tan-hioh. (8) Kih-kia-ye (Kakaya), a man of the west.

Northern Liang (Capital Ku-tsang)

(1) Shih-tao-kung. (2) Fa-Chung, a man of Turfan. (3) Sang-kia-to, a man of the west. (4) Tan-mo-tsien (Dharmakshya), a man of mid-India. (5) Buddhavarma, a man of the west (A.D. 450). (6) Shi-chi-mang.

Sung Dynasty (Capital Kien Kang)

(1) Buddhajiva, a man of Cophene. (2) Tan-mo-mi-to (Dharmamitra), a Cophene man. (3) Kalayasas, a western. (4) I-ych-po-to (Iswara), a man of the west. (5) Sheh-chi-yan. (6) Gunavarma, a man of Cophene (A.D. 440). (7) Gunabhadra, a man of mid India (A.D. 436). (8) Dharmavira (A.D. 420-53). (9) Chu-fa chuen, an Indian (A.D. 465).

Tsi Dynasty (Capital Kien Kang)

(1) Tan-mo-kia-to-ye she (Dharmajatasayas), a man of India. (2) Mo-ho-shing (Mahayana), from the west (A.D. 490). (3) Sanghabhadra, from the west (A.D. 489). (4) Dharmamati, a man of the west (A.D. 49). (5) Gunavati, a man of India (A.D. 493).

Southern Wei Dynasty.

(Capital Loyang)

(1) Dharmaruchi of South India (A.D. 504), (2) Bodhiruchi of North India (A.D. 508), (3) Le-na-mo-ti (Ratnamati) of mid India (A.D. 508), (4) Buddhāsanda, of North India (A.D. 525).

Liang Dynasty.

(Capital, Kieng Kang)

(1) Mandala of Cambodia (A.D. 504), (2) Sanghavarma (of Cambodia 502), (3) Paramita (of Ujjein, A.D. 549).

Eastern Wei Dynasty.

(Capital Keng Nieh)

Gotamaprajnaruchi (of South India, born in Benares; A.D. 542).

Tsi Dynasty.

(Capital Nieh)

Nalandayasas (of North India, 569).

Chen Dynasty.

(Capital Nieh)

The son of the King of the country of Ujjein named Upasena.

Chow Dynasty.

(Capital Changan)

(1) Jnanabhadra (A.D. 560), (2) Jnanayasas from Magadha (A.D. 572), (3) Yasakuta, a man from Udyana (A.D. 578), (4) Jnanakuta from Gandhara (A.D. 588), (5) Dharmaprajna (583), (6) Vinataruchi (of Udyana, 583), (7) Dharmagupta (S. India, 591).

The list is not exhaustive. Bunyiu Nanjio's *Catalogue of the Chinese Translation of the Buddhist Tripitaka, the Sacred Canon of the Buddhists in China and Japan* may be referred to.

These are the names of scholars, lay as well as clerical, and Chinese as well as foreign, who settled in various parts of China to translate and propagate Indian thought during the four hundred years between Han and Tang Dynasties. It is, therefore, natural that when the great Renaissance commenced under the unified rule of the mighty Tangs all this literature should have become the food of the master-minds of China. They got used to thinking not in terms of China alone but of the great western land of the Hindus as well. And when the great Hiuen Tshang, "the Max Muller of his day," came back to his people, the conception of the Indo-Chinese world as a single unit became, as it were, a first postulate with them.

Hiuen Tshang came back in A.D. 645, and It-sing, another equally famous pilgrim, went out on a tour in 671 which lasted for 24 years. His diary has been translated by Dr. Takakusu: *A Record of the Buddhist Religion as practised in India and the Malay Archipelago*. In it we get an account of no less than sixty Chinese Buddhist pilgrims who visited India in the latter half of the 7th century. It is thus not difficult to see why the Tang epoch of Chinese history was a great age for the unity of Asia.

(b) SINO-INDIC, SINO-ISLAMIC AND SINO-JAPANESE SEA-BORNE TRADE.

It was not only an age of foreign travel but an epoch of brisk foreign commerce as well with every people in Asia. In fact, the journeyings of those Asia-trotters were made possible through the establishment of well-laid-out routes between country and country. The routes were both overland and maritime.

It is needless to observe that the "Asia-sense" was promoted not only through the culture-missionaries, truth-seekers and religious pilgrims, but also through the commercial agents, brokers, sailors and speculative adventurers.

The sea-trade of the Asiatic peoples was, of course, facilitated by their shipping and navigation. Mookerji's *History of Indian Maritime Activity from the Earliest Times* throws a flood of light on this aspect of the question during the period under survey. During the Tang age the command of the Indian Ocean was maintained by the powerful fleet of the Chola Emperors in Southern India.

The shipping was international. Both the Arabs on the West and the Chinese on the East were equally adept in using the highway of the seas. The following is taken from Hirth and Rockhill's *Chau Ju-kua*:

"The pilgrim Fa Hien, the first Chinese who has left a record of a voyage from India to China (A.D. 413), came from Tamlook at the mouth of the Ganges to Ceylon to sail for Sumatra, and when in Ceylon he noted the signs of wealth of the 'Sa-po' traders' on the island, and it does not seem unlikely that these foreigners were Arabs from Hadramant and Oman coasts."

It is to be noted that Fa-Hien's fellow-passengers from Java to Canton were *Pe-lo-mon* or Brahmans.

Further, Cosmas in the sixth century says of Ceylon:

"The Island being, as it is, in a central position, is much frequented by ships from all parts of India from Persia and Ethiopia, and it likewise sends out many of its own. And from the remotest countries, I mean Tzinista (China) and other trading places, while at the same time exporting its own produce in both directions."

The present position of Ceylon as the great port of call for world's shipping has thus been a historic one, coming down from the age when the Asiatic waters were navigated by their natural masters.

A history of Chinese maritime activity would show that the Celestial enterprise in navigation probably manifested itself a little later than that of the Arabs and Hindus. According to Hirth and Rockhill—

"Notwithstanding the lack of enterprise on the part of the Chinese in the first centuries of the Christian era, commerce by sea with south-eastern Asia and the countries lying to the west was steadily increasing through the continued energy and enterprise of the Arabs and the Indians."

But the sea-voyages of the Chinese

became considerable under the Tangs. It-sing mentions 60 Chinese pilgrims who in the latter part of the seventh century made the journey to India. Of these 22 travelled overland and 37 took the sea-route. The following itinerary is described in the Introduction to *Chau-Ju-kua*:

"* * The port of embarkation being Canton, whence the travellers made for western Java or more usually Palembang in Sumatra. Here they changed ships and taking a course along the northern coast of Sumatra and by the Nicobar Islands, came to Ceylon, where they usually took ship for Tamlook at the mouth of the Ganges and thence reached the holy places of India by land. The voyage took about three months, one month from Canton to Palembang, one to the northwest point of Sumatra and one to Ceylon; it was always made with the northeast monsoon in winter, and the return voyage to China in summer,—from April to October—with the southwest monsoon."

The "Asia-sense" of the Chinese, so far as it was developed through international commerce, was steadily on the increase during the 8th and 9th centuries, may have been a little retarded owing to the disorder following the fall of the Tangs, but revived in the 10th century "when they carried on direct trade with the Arabs, the Malay peninsula, Tongking, Siam, Java, western Sumatra, western Borneo and certain of the Philippine Islands." The more important ports like Canton and Tsuan-chou near Amoy began to have prosperous settlements of permanent Hindu and especially Moslem residents. The importance of Islam * in Chinese life during the 9th and subsequent centuries would be evident from the following statement: "From Chinese sources we learn that * * at Tsuan-chou, Hang-chou and elsewhere, the Moslems had their *kadi* and their *sheikhs*, their mosques and their bazars." The institution of the Inspectorate of Maritime Trade at Canton, Kangshi (the capital), Tsuan-chou, Hang-chou and Minchou, also indicates the larger social life of the Celestials.

Chau-Ju-Kua was the Inspector of Foreign Trade at Tsuan-chou in Fukien, in the latter part of the 12th century. His *Chu-fan-chi* or 'Description of the Barbarous Peoples' tells of what the Chinese at the beginning of the 12th century knew of the foreign countries, peoples and products of Eastern and

* It need be remarked incidentally that the Capital Singanfu received during this age Christian and Zoroastrian exiles who fled from their West Asian homes to escape the persecution of the Islamites.

Southern Asia, Africa and Europe. It precedes by about a century the account given by Marco Polo of Venice (1260) and "fills a gap in our knowledge of China's relations with the outside world extending from the Arab writers of the ninth and tenth centuries to the days of the great Venetian traveller." The English translation of this work by Hirth and Rockhill published by the Imperial Academy of Sciences, Petrograd, is of inestimable value to students of international commerce in Medieval Asia.

When Japan entered upon the scene the Indo-Chinese world was expanded by the addition of a third member. The triple alliance of culture thus effected was the *San-goku*. Every Japanese thought in terms of the three regions, not of his native land alone. It was not enough, according to their conception, for any person to attain the highest position only in Japan. The most ambitious among them must have his worth recognised by China and India too. An international or Asiatic standard of science or *Vidyas* governed the aspiration of all Japan. *San-goku* is thus a suggestive technical term contributed by the Japanese to the literature of world's international science.

It has to be observed that, culturally speaking, the heart of this Concert of Asia was Hindusthan, *Tienchu* or *Tenjiku*, i. e. Heaven; but geographically, the heart was China. This "middle kingdom" may or may not be the middle of the whole world as the Chinese have believed it to be; but it was surely the middle or centre of *San-goku*. The Chinese received Hindusthan into their midst and then passed it forward to the Land of the Rising Sun. The first process was Indo-Chinese, and the second Sino-Japanese. It is doubtful if there was much direct Indo-Japanese intercourse. The Japanese depended for their Hinduism principally on their neighbours.

We know definitely that cotton was introduced into Japan from India. Prof. Takakusu in his paper on '*What Japan Owes to India*' in the Journal of the Indo-Japanese Association (1910), states that cotton was introduced into Japan through the Indians who were unfortunately carried over to that country by the "black current." The following is taken from Mookerji's *Indian Shipping*:

"The eighth volume of the *Nihon-ko-ki* records how in July 799 a foreigner was washed ashore in a little

boat somewhere on the southern coast of Mikawa province in Japan. He confessed himself to be a man from Tenjiku, as India was then called in Japan. Among the effects was found something like grass seeds, which proved to be no other than some seeds of the cotton-plant. Again, it is written in the 199th chapter of *Ruijin kokushi* (another official record) that a man from Kuen-lun was cast upon Japanese shores in April 800, and that the cotton seeds he had brought with him were sown in the provinces of Kii, Awa, Sanuki, Iyo, Tosa and Kyushu."

We hear also of Brahman Bishops coming to Japan from countries other than China. But probably there are few evidences to connect them with India. They may have been Hindus from Annam, Cambodia or Indo-China. The principal reservoir of Indianism for Japan always remained China.

It is for this reason that we find innumerable materials for the history of India in China and Chinese literature; and materials for Chinese history in the Japanese and Chinese literature of Japan. The Island Empire thus happens to be the repository or museum of the Indo-Chinese world. It is perfectly natural, therefore, that *San-goku*, the technical term comprehending the three countries, should exist in the Japanese currency of thought.

THE "GREAT POWERS" OF *San-goku*.

The political history of China during this period falls into two divisions.

1. The Tang Dynasty ruled from A.D. 618 to 905. Tai Tsung (627-50) is the most illustrious Emperor of this dynasty and is one of the Chinese Napoleons. He was the patron of Hsien Tshang.

2. The Sung Dynasty ruled over the whole Empire from A.D. 960 to 1127. In 1128 the northern half down to the Yangtse was conquered by the Tartars, who established their capital near the site of modern Peking. The Sung Dynasty continued to rule the southern half of China down to 1279 with capital first at Nanking, then at Hangchow.

The political strength and military achievements of the Tangs could not be maintained by the Sungs. But the people of China carried forward the intellectual and spiritual development of the 7th and 8th centuries down to the end of the period. So that the whole age was one of continuous cultural growth and expansion. In fact, the most brilliant era of Chinese literature, art and philosophy coincided with the last days of the Sungs.

The important landmarks in the

political history of Japan are indicated below :

1. From A.D. 552 to 710 the centre of government and culture was in the province of Asuka. This is, practically speaking, chronologically the first period of Japanese history. The most illustrious name is that of Prince Shōtoku Taishi (A.D. 573-621), who was regent for the reigning Queen Suiko. During this period the scholar Doshō is said to have come to China in 653 to study Hinduism with Hiuen Tshang after his return from India in 645. Thus the conception of *San-goku* was forced upon Japan in her very infancy.

2. The Nara Period (from 710 to 794) was synchronous with the period of Tang strength in China. The capital was removed to Nara near Osaka.

3. The Kyoto Period (782-1192) came down to the dismemberment of Chinese Empire under the weaker Sung. The capital was transferred from Nara to Kyoto, which remained the Imperial seat till the beginning of the new era in the middle of the 19th century. Kyoto is thus the Delhi of the Japanese. During this period the famous scholar-saint Kobo Daishi visited China (804-806) and came back to his native land to establish the Indo-Chinese culture on a thoroughly national basis.

4. The Nara and Kyoto periods are sometimes called the Fujiwara period because at both these centres the Fujiwara aristocracy lorded it over the whole administration. This period is of extraordinary interest to students of *San-goku* culture, because specimens of Chinese life during its most brilliant epoch (and therefore of the Hindu also) are still preserved in the Japanese art of the age, but are lost elsewhere. Japan, thanks to her insular position like that of England, has been saved from the ravages of foreign conquests which have come upon her continental neighbours; and thus has been able to maintain intact the mediæval civilisation of Asia represented by the Kalidasas and Fa-Hsuns of Vikramadityan Renaissance.

5. Kamakura Period began with the establishment of the *Shogunate* or military Viceroyalty at Kamakura in 1192. The Emperor became a political cipher and remained virtually a prisoner at Kyoto until the glorious Restoration of 1868.

In India the political life of the period has to be studied in the following more important Empires :

1. The Empire of Harshavardhana who reigned in Upper India from 606 to 647. He was thus the contemporary of Tai Tsung and also of Prince Shotoku. Hiuen Tshang was the state-guest (629-45) of the Hindus under this monarch.

2. The Empire of the Chalukyas (550-753) in the Deccan. The most illustrious monarch of this dynasty was Pulakesin II (608-55) who inflicted a defeat on the northern Emperor Harshavardhana and thus maintained the sovereignty of the Southern Empire. Hiuen-Tshang visited his court in 641. Pulakesin II is important to students of art-history because some of the world-renowned paintings in the cave-temples of Ajanta were executed during his reign, e.g., those relating to Indo-Persian embassies.

3. The Empire of the Gurjara-Pratihara at Kanauj in Upper India (A.D. 816-1194). Vincent Smith remarks :

"Mihira, usually known by his title Bhoja, enjoyed a long reign of about half a century (c 840-90) and beyond question was a very powerful monarch, whose dominions may be called an 'empire' without exaggeration."

4. The Empire of the Bengalees under the Pala Dynasty (A.D. 730-1175) in Eastern India. Vincent Smith remarks :

"The Pala dynasty deserves remembrance as one of the most remarkable of Indian dynasties. No other royal line, save that of the Andhras, endured so long as four and half a centuries. Dharmapala and Devapala succeeded in making Bengal one of the great powers of India."

A complete history of this 'great power' by Rakhaldas Banerji written in the Bengali language has been recently published at Calcutta. The Pala age is important in the history of Tibet as having supplied her with Bengali art and Tantric literature. Dharmapala and Devapala, whose reign extended from 780 to 892, were the Tai Tsungs of Bengal.

5. The Empire of the Cholas in Southern India (900-1300). The most illustrious monarchs of this dynasty were Rajaraja the Great (985-1018) and Rajendrachola (1018-1035). The Cholas possessed a powerful navy, which led to the annexation of a large number of islands and the kingdom of Pegu in Further India across the Bay of Bengal. Mr. S. Krishnaswamy Aiyangar's *Ancient India* is the most authoritative and complete work on Chola Dynasty and South Indian history available in English.

INDIANISATION OF CONFUCIANISM.

The intercourse between India and China during this period is thus described by Okakura :

"Communication with India becomes more facilitated by the extension of the empire on the Pamirs, and the number of pilgrims to the land of Buddha as well as the influx of Indians into China, grows greater every day. The newly opened route through Tibet, which had been conquered by Taiso,* added a fourth line of communication to the former routes by Tansen and the sea. There were at one time in Loyang (Honanfu) itself, to impress their national religion and art on Chinese soil, more than three thousand Indian monks and ten thousand Indian families : their great influence may be judged from their having given phonetic values to the Chinese ideographs, a movement which, in the eighth century, resulted in the creation of the present Japanese alphabet."

Hsien Tshang had witnessed the processions, mystery-plays, and other folk-festivals patronised by Emperor Harshavardhana at Kanauj and Allahabad. The educative influence of these institutions worked upon his imagination; and it is likely that on his return to China he may have played some part in the organisation of the popular dances, ballets and other amusements† which began to be important features of Chinese life under the Tangs.

Mr. Werner quotes from the *Contemporary Review*, (XXXVII. 123): "It was not until the sixth century A.D. that some travelling gymnasts from India initiated the people into the delights of the rude pantomimic dances and acrobatic performances of their native land." The French scholar Bazin's *Theatre Chinoise* throws interesting light on the history of games, festivals, ballets and pantomimes of China. Hindu influence is also suggested by scholars as having given the final shape to the drama which has been played in China since the time of the Tangs.

The following are the names of some of the Hindu scholars in China who helped It-sing in the propaganda work among his people early in the 8th century :

1. Anijana, a priest from Northern India
2. Dharmamatma, priest from Tukhara
3. Dharmananda, " " Cophene
4. Sringisha, layman from Eastern India
5. Gotamavajra " " "
6. Hrimati
7. Aijun, Prince of Cashmere.

* Japanese name of Emperor Tai Tsung.

† The "No"-plays which became popular in Japan in the 14th century may have to be traced ultimately to Hindusthan.

The list is taken from Beal's *Buddhist Literature in China*.

It is thus easy to understand why the whole world of Chinese letters and art should become Hinduised during their great age of Renaissance. Giles' *History of Chinese Literature* may be referred to for specimens of Tang and Sung thought in prose and verse. The following is from Cranmer-Byng's *Lute of Jade* :

"Po Chü-i (A.D. 772-846) is above all the poet of human love and sorrow, and beyond all the consoler. Those who profess to find pessimism in the Chinese character must leave him alone. At the end of the great tragedy of *The Never-ending Wrong*, a whispered message of hope is borne to the lonely soul beating against the confines of the visible world :

'Tell my lord,'

She murmured, 'to be firm of heart as this Gold and enamel; then in heaven or earth

Below, we twain may meet once more.'

It is the doctrine of eternal constancy, so dimly understood in the Western world, which bids the young wife immolate herself on her husband's tomb rather than marry again, and makes the whole world seem too small for the stricken Emperor with all the youth and beauty of China to command."

The Hindu, with his idealism of the *Sati*-institution which expresses itself in the determination of the widow not to remarry, would easily understand this. Nivedita's *Web of Indian Life* and *An Indian Story of Love and Death* give excellent English studies in Hindu womanhood.

The result of the influx of Hindu ideas, institutions and practices was not confined solely to the popularisation of the Buddhacult. The original Chinese ideas on every subject began also to be transformed, re-interpreted and Hinduised. The Augustan age of Chinese Culture was thus the age of a thorough-going Indianisation of China.

It must be understood that this Indianising affected not the religious sphere exclusively, but led also to the introduction of the secular *vidyas* or sciences, and *kalas* or arts.

Influences emanating from India during the great age of China were not likely to be one-sided. Smith's paper on Indian sculpture of the Gupta Period (300-650) may be referred to in the *Ostasiatische Zeitschrift*.

The *Journal of the Peking Oriental Society* (ii 228) is quoted by Werner :

"It remained for the authors of the Tang dynasty to combine Taoism and Confucianism with a mixture of Buddhism, in a newly created poetry which was

destined to raise literary art to a higher elevation than it had ever attained in China."

Indianism touched not only Taoism but also had a profound influence on traditional Confucianism. The Confucianism that has been prevalent in China for the last eight or nine hundred years is markedly different from the older one, and was born in the atmosphere of the Hindu Culture which prevailed under the Tangs and Sungs. Elkins has described the effect of Buddhism on the philosophy of the Sung Dynasty in chapter xx of his *Chinese Buddhism*.

About this neo-Confucianism a Japanese scholar writes in *An Official Guide to Eastern Asia, Vol. IV, China*, prepared by the Imperial Japanese Government Railways:

"With the establishment of the Sung Dynasty..... appeared philosophers who in expounding the classics brought to their aid certain cosmic and metaphysical ideas of India....."

Chu Hsi (1130-1200) is regarded as the founder of the Sung school of Confucianism. And whatever influence Confucianism exercised—and it has been great—in the training of a nation like Japan, must be largely ascribed to the works of this great philosopher and commentator."

Hindu *Dhyana* or meditation is the chief characteristic of this re-interpreted Confucianism.

The art of painting as well as the criticism of that art were also being influenced by the new philosophy which finally received an authoritative stamp from Chu Hsi. The following is quoted from the section on "Art in the times of the Five Dynasties and of the Sung Dynasty (907-1279)" in the Japanese Official Guide:

"Criticism, under the influence of the new subjective philosophy of the Sung period, took a fresh turn. Kuo To-hsu (in the Northern Sung Period) interpreted *Chi-yun* (life of the painting) in a subjective way, and pointed out that in the case of all kinds of painting, whether of animate or inanimate objects, the *Chi-yun* apparent in them was the personality of the painter. He said that an artist of noble character was sure to impress his personality on his production and that no skill in the technique could ever confer the refinement and grace which *Chi-yun* implied. He finally came to a bold conclusion that in true art there was no need of technique..... Su Shih (1036-1101) and Huang Shan-ku (1045-1105)..... both held the opinion that the object of painting was not to make a sketch of the external appearance of things, but to give intimation of the life and power immanent in nature."

The *dhyana*-element in art is thus emphasised in the Hindu work, *Sukraniti* (IV. iv. 147-9):

"The characteristic of an image is its power of helping forward contemplation and Yoga. The human maker of images should, therefore, be medi-

tative. Besides meditation there is no other way of knowing the character of an image—even direct observation (is of no use)."

Here, then, is the fountain-head* of the neo-Confucianist art.

The Japanese term for *Dhyana* is *Zen*. That this subjective philosophy of Meditation did not promote imbecility in secular life would be evident from the importance that the Buddhist scholars of Japan attach to the *Zen*-factor in the interpretation of their *Bushido* or *Kshatriyaism*. It may be equally argued that Hindu *Samurai*-morality or Militarism was also strengthened by the element of *Samyama*, i.e., temperance or self-restraint, involved in *Dhyana* or *Yoga* discipline.

There is one fact about this Hinduisation of Asia which the most superficial student of mediæval history must notice. Indian missionising in foreign countries—

(1) was not backed up or preceded by military, political or punitive demonstrations of any sort on behalf of the Indian States;

(2) was not carried on at the point of the bayonet or of the machine-gun or with the offer of inducements to a better socio-economic life;

(3) did not imply the direct or indirect domination of a "superior" race over semi-savage tribes or the so-called "arrested" sections of mankind.

It was, in fact, not a visible expression of Hindu Secular Power or the Might of the Indian State. Rather, the apostles of Hindu Culture consecrated their lives to the service of humanity. They

(1) adapted themselves to the manners, customs, sentiments and prejudices of the communities which they adopted as their own, thereby obliterating the distinction between alien and native;

(2) were absolutely non-political and non-commercial representatives of their mother-land, casting their lot with the "flock" which they came to tend;

(3) were deliberately accepted as *gurus* or preceptors by the first-class civilised Powers and the greatest intellectuals among their peoples, who wanted fresh light upon their problems.

Hinduising was thus the transmission of a new life and a new love from an equal to an equal. An "age of chivalry" was that.

* See I. aufer's *Das Citralakshana* in the *Ost-Zeit.* January—March, 1914.

"RINGING GROOVES OF CHANGE" IN ASIA.

Prof. Takakusu makes the following remarks on Japanese Buddhism in *The Fifty Years of New Japan* issued by Marquis Okuma as a manifesto for Japanese Culture after the event of 1905:

"It was not, therefore, a mere transplanting of the Buddhism of India, China, Annam, or of Korea, but a new and distinct form of religion.

Thus Buddhism in Japan has never remained inactive or become effete, but reaction has followed reaction, and reformation reformation—a constant refining and remodelling going on to meet the needs of the people. The old religion cannot satisfy thirsty souls, and this generation requires of the Buddhists not only new activities in their religion, but constantly renewed activity. And if this ancient religion is to come forth into the arena of the twentieth century with fresh vigour and activity, and preach new glad-tidings to the world, it will be the Buddhism of Japan."

To say that the Buddhism of Japan differs from that of China and of India, or that the Japanese Buddhism of the twentieth century will differ from that of the nineteenth as that again has differed from all previous, is to take a perfectly scientific attitude with regard to human civilisation.

A similar philosophic view about Christianity has been put into the mouth of Mr. "Little Boston" by the American humorist Oliver Wendell Holmes in his *Professor at the Breakfast-Table* :

"The divinity-student remarked, that it was rather late in the world's history for men to be looking out for a new faith.

I didn't say a new faith,—said the Little Gentleman ;—old or new, it can't help being different here in this American mind of ours from anything that ever was before ; the people are new, Sir, and that makes the difference.

..... There was a great raft built about two thousand years ago,—call it an ark, rather,—the world's great ark !

It's a slow business, this of getting the ark launched. The Jordan was not deep enough, and the Tiber was not deep enough, and the Rhone was not deep enough, and the Thames was not deep enough."

"It must be done, Sir !—he was saying, —it must be done ! Our religion has been Judaized, it has been Romanized, it has been Orientalized, it has been Anglicized, and the time is at hand when it must be Americanized !"

One might be inclined to smile over these outbursts of local patriotism, but it is impossible to deny the influence of Place and Race on Ideas.

Asiatic Culture is one, but is richly varied. It has grown from epoch to epoch and has changed in its transplantation from the banks of the Indus and the Ganges

to the shores of the Hwang-ho and the Yang-tse, and thence again to those of the Yedo-gawa and the Sumida-gawa. Unfortunately, however, scholars of the last century have been pleased to explain the whole history of Asia by such poetic and sonorous expressions as "unchanging East" or "better fifty years of Europe than a cycle of Cathay." They have yet to learn that Asiatic history is as dynamic and as good a record of changes as the history of Europe.

Compared with "the 'revolutionary changes that the world has witnessed since the Industrial Revolution of the second and third decades of the nineteenth century, the changes in the previous five millenniums must be regarded as insignificant. It may be said that the world had not changed so much from the age of the Pharaohs down to 1815 as it has changed during the last hundred years. Thus considered, Ancient and Mediaeval Europe down to 1815 must be treated as statical and unchanging, without any fundamental difference from Cathay, the proverbial land of sloth and conservatism. "Fifty years of Europe" in the 19th century are "better" than any cycle of Europe in the 17th, 16th, 15th and previous centuries.

Orientalists, sociologists and philosophers should, therefore, remember that it is not safe to take a Tennyson or a Whitman as the guide for historico-comparative investigations.

It was an altogether extraordinary state of things that Tennyson lived to see. The following remarks about his age—

"When more and more the people throng
The chairs and thrones of civil power,
When science reaches forth her arms
To feel from world to world, and charms
Her secret from the latest moon,"

could not be made with regard to any previous age in European history.

Tennyson's optimism was a product of the age which everywhere "rang out the old" "to ring in the new." He was writing of the "forward range" and "the ringing grooves of change," while the whole "old order" was crumbling down before his eyes, and the new order was apparently carrying everybody headlong to "that far-off divine event to which the whole creation moves."

The impulse of the age was equally

potent in stimulating the imagination of Whitman when he wrote:

- "The immortal poets of Asia and Europe have done their work and pass'd to other spheres.
A work remains, the work of surpassing all they have done."

It was an age when the New Englanders of the East coast were expanding towards the "middle West," "farther West," and "farthest West." In that colonising period every Yankee could talk glibly:

"For we cannot tarry here.

We must march, my darlings, we must bear the
brunt of danger.

We the youthful sinewy races, all the rest on us
depend.

Pioneers! O pioneers!

Have the elder races halted?

Do they droop and end their lesson, wearied over
there beyond the seas?

We take up the task eternal, and the burden and
the lesson,

Pioneers! O pioneers!

All the past we leave behind,

We debouch upon a newer, mightier world, varied
world,

Fresh and strong the world we seize, world of
labour and the march,

Pioneers! O pioneers!"

Any one in his cooler moments would see that these lines describe extraordinary conditions. The lofty flights of idealism and progressivism in the English poet-laureate of the Darwinian age and the American poet of the colonising period do not supply the norm by which to express the character of Euro-American civilisation previous to the epoch-making changes.

They cannot be the *sntras* for the West down to 1815. The poet's *dicta*, therefore, should not be the formulae with which to begin the study of Asiatic Culture. Un-biassed students of facts would find in the history of both Asia and Europe almost the same statical or dynamical pictures. Similarly the last "fifty years of new Japan" do not represent the previous fifteen hundred years.

The remarkable achievements and extraordinary successes of one's own generation may lead rhapsodists to poetise over one's race-history and race-destiny; but scientists must not forget to place them in their historical setting and read them in the light of the perspective. As it is, all the social sciences have been vitiated by poetry and race-pride during the last fifty years.

When Tennyson wrote "Cathay" he knew as much of China as we know of the moon. If anybody had suggested to him the name of "Mackay" or of "Pankhay," it would have suited the rhyme of his verse quite well; and as for readers, they would have to consult a *Dictionary of Unfamiliar Names* for 'Cathay' as well as for the others.

But a poet never errs. Therefore the verse is now the basis of sober history and the starting-point of race-theories. Thus an author begins his *Introduction to the History of England* with the following syllogism: "History is a record of changes. The Asiatic peoples have no history, because they have had no changes!"

THE THEORY OF LIFE ASSURANCE

By G. S. MARATHEY, M.A., A.I.A., ACTUARY.

GENERALLY every literate person has heard something about Life Assurance, but there are many even among highly educated people who do not understand how it is possible to pay Rs. 1000 (say) on death when the assured has paid only Rs. 20 or 25, only the day before. There are many other points connected with the principles of Life Assurance, through ignorance of which, a person is made to insure his life in a manner entirely

unsuited to his circumstances by unscrupulous agents of Insurance Companies having little or no respectability. It is very hard for persons of limited means to realize, some time after they have paid their first premium, that the Company in which they have insured, is not a very desirable concern. For Life Assurance Premiums swallow up a large part of one's hard earned savings, and it is a hardship either to forego the premium that has al-

ready been paid or to continue paying the premiums and fulfil a bad bargain. It is desired therefore, in the present article, to give some information about certain important points in connection with Life Assurance. The principal idea in writing the following will be to supply such information as will enable a person, desiring to ensure his life, to discuss intelligently, with a Life Assurance Agent, the merits and defects of the Company which the latter represents and to make the choice of a plan which would be suited to his own circumstances.

Every one among us, especially among those of us who are Hindus, has been so impressed from childhood about the instability of human life, that it would be a surprise to many to learn that even births and deaths are regulated by a sort of Mathematical Law, which, though ordained by the Almighty, can yet be sufficiently gauged, for many practical purposes, by the human mind. Though it is not possible to say when a man will die, it would not be considered foolish to form an opinion whether he is likely to die soon or live long. All business in this world is done with the help of inferences which are generally never perfect on account of the defects in individual reasoning faculty. The science of statistics tries to remove these defects by bringing together the experience of a large number of persons and enabling trained intellects to make use of the same. With the help of the science of statistics, it has been proved that the births and deaths in a large community happen in such a manner as to suggest a law underlying them; and the larger the number of persons in a community which is being observed, the more definite does this law become. This will be evident on considering the rates of mortality in a village, in a town, in a city, or in a district as well as the daily, monthly, or annual mortality in a particular place.

Also it would be more useful to look at these rates relatively rather than absolutely for example such circumstances as whether the population is increasing or decreasing, whether the people are rich or poor, whether the district is healthy or unhealthy, are likely to have great effect upon the rate of mortality. It is impossible to find out what would be the rate of mortality in the absence of all *special* causes, but life-tables can be formed

for particular circumstances and marked distinctions of sex, race, locality, occupation etc Life tables are tables showing the number of persons surviving at every advancing age out of a definite number of persons all of the same commencing age. The principal distinction is that of sex.

I give below some figures from the H.M. table of mortality in which it has been assumed that we are observing the numbers of survivors out of 100,000 males aged 10 years. In 10 years' time only 96,223 of these will have survived. The H.M. (i.e. Healthy Males) table is a table prepared from the observations of male persons in England who had insured their lives from 1833 to 1882. In the first table I am giving the figures for every consecutive year of age from 20 to 25; and in the second I am giving figures for every tenth year of age from 10 onwards and the figures for the last year of age in the table.

H. M. Table—ages 20 to 25

Year of age	Alive at beginning of year	Deaths in year	Deaths per thousand	Expectation of Life	
				years	months
20	96,223	609	6.33	42	1
21	95,614	613	6.73	41	4
22	94,971	650	6.84	40	7
23	94,321	638	6.76	39	11
24	93,683	622	6.64	39	2
25	93,061	617	6.63	38	5

H. M. Table Decennial ages

Year of age	Alive at beginning of year	Deaths in year	Deaths per thousand	Expectation of Life	
				years	months
10	100,000	499	4.9	56	3
20	96,223	609	6.3	42	1
30	89,865	694	7.7	34	8
40	82,284	848	10.3	27	5
50	72,726	1124	15.5	20	4
....
97	9	9	1000.00	0	6

I also give below similar figures from the O. M. table, which is prepared from the experience of persons insured from 1863 to 1893.

O.M. Table Decennial Ages

Year of age	Alive at beginning of year of age	Deaths in year	Death rate per thousand	Expectation of Life	
				years	months
10	100,000	338	3.38	52	0
20	96,453	390	4.04	43	8
30	91,942	547	5.95	35	9
40	85,467	782	9.15	27	10
50	76,185	1146	15.04	20	7
100	7	4	571.43	1	1
102	1	1	1000.00	0	6

The O table, being the more recent one is of greater importance; and it is more so because the number of persons observed is much larger and the methods employed in the preparation of the table are scientifically more up-to-date.

The last column in the above table does not mean that every person would live over that period; some may die sooner and others would live longer. The figures give the average.

The death rate per thousand is obtained by multiplying the numbers in the third column by a thousand and dividing by the corresponding numbers in the second column.

One of the facts which are noticed from such tables is that the death rate which is very high in infancy diminishes till age 14, then begins to increase upto age 20 or 22, then again diminishes for the next 4 or 5 years of age and after that it keeps on increasing more and more rapidly.

The death rate among females is slightly greater than that among males up to age 50 and then it becomes less. The principal cause of this is the bad effects on health of child-bearing.

The above tables are tables prepared from the experience of select lives, i.e. of persons who had undergone a medical examination at the time of being insured. For this reason and also because these lives belonged to a rather well-to-do class of persons, they were a superior class of lives. These tables are only used for insurance purposes i.e. construction of premiums etc.; but the tables that are usually referred to for most other purposes are tables prepared from population statistics. These are prepared from figures obtained from census enumerations, and show a much higher mortality.

We shall now go on to consider how mortality tables are used for constructing premiums. We shall use the H table and shall first consider, for the sake of simplicity, only temporary assurance, or Term Assurance as it is called, for a period of one year. Suppose a hundred thousand persons, all of twenty years of age, decide to pay a certain sum each, in order that the heirs, of each of those among them who will die in the course of one year, should be able to get Rs. 1000. From the table we may expect that about 663 persons will die during that year. The heirs of these

must receive Rs. 663000 in all. Hence every one should pay Rs 6-10-1. This is called the 'Net Premium'. It may happen however that a larger number, say 700 or 750 persons may die instead of 663. To be prepared against this, it is better to collect a larger amount than the Net Premium. Also some expenses will be incurred for collecting and distributing this large amount of about Rs. 700,000. These, which are called office expenses, have to be charged for in constructing the premium. In addition to this, if a Company is formed for doing all this, the shareholders must get their profit on the capital they have invested. All these additions that are made to the Net Premium are called Loadings.

Of course in the above example no return is to be made in case death does not occur. The return for the contribution made is obtained in the form of freedom from anxiety about the surviving heirs, getting into difficulties for want of funds. If any of these hundred thousand persons are not in good health, or stand a greater chance of dying during the year, they get an undeserved advantage over the others. Hence the necessity for medical examination of all before admission. If the risk of death is not prohibitively great, persons with slightly damaged health may be admitted on payment of an extra premium.

The premium including the loadings would come to about Rs. 10 (not including medical fees or some other charges which are heavy for the first year in ordinary assurances). Why is it then that Insurance Companies charge Rs. 25 or more per annum for Whole Life Assurances? The reason is that the Premium charged by Companies is Uniform for the whole period of payment, not changing from year to year. Also there is no medical examination to undergo every year. The Net Premium for one year's Term Assurance at age 65 would be above Rs. 43, at age 75 it would be above Rs. 981 and at age 95 it would be Rs. 637. The loading would make these figures still higher and there would be the charges for medical examination every year. In case the health is not satisfactory in any year the life would not be acceptable for insurance or a heavy extra may be charged.

Up to now we have considered mortality only. But the rate of interest also plays a large part in the construction of premi-

ums. Out of the Premiums collected in the first year, the expenses and the amount of claims (if any) having been paid, a large balance remains, the interest earned on which forms a respectable addition to the premium income. Hence it is possible to reduce the amount to be received as Premium. The benefits of compound interest may be illustrated by the following figures.

A sum becomes double at 3 p. c. compound interest in 23½ years and 5 p. c. in 14½ years. Rs. 1000 amount in 50 years to Rs. 4381 at 3 p. c. and to more than Rs. 18400 at 5 p. c. A single Rupee at the rate of one per cent. per mensem (Compounded monthly) amounts, in a hundred years, to more than a lakh and a half rupees.

To give a concrete example I shall try to find the premium for an Endowment Assurance for 5 years. The rate of interest I shall assume to be 4 p.c. and for the mortality, in order to simplify the question, I shall assume that there are 100 persons who have insured out of whom 4 die in the first year of assurance, 5 in the second, 6 in the third, 7 in the fourth, and 8 in the fifth; while 70 survive the 5 years. The beneficiaries of each of those who die during the five years will get Rs. 1000 and these assurers who survive the five years will get Rs. 1000 each. If we find the present value of all future receipts and payments we get the following simple equation :

$$100 P + 96 P \times \frac{1}{1.04} + 91 P \times \frac{1}{(1.04)^2} +$$

$$85 P \times \frac{1}{(1.04)^3} + 78 P \times \frac{1}{(1.04)^4} \\ + 4 \times 1000 \times \frac{1}{1.04} + 5 \times 1000 \times \frac{1}{(1.04)^2} \\ + 6 \times 1000 \times \frac{1}{(1.04)^3} + 7 \times 1000 \times \frac{1}{(1.04)^4} + 8 \times 1000 \times \frac{1}{(1.04)^5} + \\ 70 \times 1000 \times \frac{1}{(1.04)^5}$$

where P is the net premium required. It has been assumed that all premiums are paid in the beginning of the year and all claims are paid at the end of the year in which they occur. From the above we get

putting $\frac{1}{1.04} = v$.

$$P = \frac{(4v + 5v^2 + 6v^3 + 7v^4 + 8v^5)}{100 + 96v + 91v^2 + 85v^3 + 78v^4} \times 1000 \\ = 200.384 \text{ nearly}$$

nearly, i. e. a little less than Rs. 200-6-2, which is the premium required. It seems strange that four persons having paid only Rs. 200-6-2 each, their heirs should be able to get Rs. 1000, and so on. To illustrate how this happens, I subjoin a table showing how the Premium receipts and the interest on the funds can meet the claims.

Year	Members alive at beginning of year	Premium Receipts from members		Last year's Balance Brt-Fwd		Total		Int. earned during year at 4 percent.		Funds at end of the year		Deaths during the year	Claims Paid	Balance Carried Forward		
		Rs.	As.	Rs.	As.	Rs.	As.	Rs.	As.	Rs.	As.			Rs.	Rs.	As.
1	100	20,038	6		Nd	20,038	6	801	8	20,839	14	4	4000	16,839	14	
2	96	19,236	13	16,839	14	36,076	11	1443	0	37,519	11	5	5000	32,519	11

It may be noticed that the Premium which I have calculated is a Net Premium, i. e., there is no provision in it for any other expenses of management etc. The Premiums quoted in Insurance Companies' Prospectuses are called Office Premiums. There are always three considerations when constructing Office Premiums, (1) The table of mortality (2) The rate of interest (3) Office expenses etc. In deter-

mining these it must be borne in mind that these are to be taken such as are likely to be experienced in the future.

About mortality I have already said a good deal. I have also shown what influence the rate of interest exercises in the construction of Premiums. The longer the term of Insurance the greater is the help from interest. About office expenses I have mentioned what they are due to.

These expenses depend partly on the amount of Premium and partly on the sum assured and to a small extent on neither. Agents' Commission, expenses of investment etc. depend on amount of premium; medical fees, policy stamps etc. depend on the sum assured; and establishment charges etc. depend on the number of policies. The part of the Office Premium arising from Office expenses is generally put in as an addition to the Net Premium, which latter takes account only of Mortality and Interest. This addition is made partly in proportion to the premium and partly in proportion to the sum assured. It is not usual to ignore both of these; hence the premium for 5000 is always five times the premium for 1000 (for the same age and the same kind of policy). This course is justified on account of the risk in five policies of 1000 each being more distributed than in a single policy of 5000.

It requires a considerable amount of thinking and care to determine these three elements viz mortality, interest and Expense-loading. The actual loading put in is however somewhat in excess of the loading which is considered absolutely necessary in order to counteract any adverse effects of fluctuation in the rates of mortality and interest assumed for constructing the Premiums. Besides this there is one more Loading—Profit Loading. Insurance companies issue two kinds of policies under the principal plans, participating and Non-participating; or as is more usually known, 'With Profit' and 'Without profit.' The With-profit rates are higher than Without-profit rates, as the former include the Profit Loading. The holders of With-profit policies are entitled to a share in the profit of the Company which usually are such as to more than repay the excess of With-profit premium over the Without-profit premium.

On the other hand they run the risk, in the event of any unexpected losses, to get nothing in return for the excess premium. It is generally desirable, however, to take out a With-profit policy, because these policies provide a margin of safety to the Company and the excess amount paid is very likely to come back with additions in the form of bonus. The profit Loading is greater than the difference between With-profit and Without-profit premium, so that if the expected profits are realised, the With Profit policy is decidedly cheaper than

the Without-Profit Policy. Without-profit policies are taken by over-economical persons and for financial purposes such as providing security for loans, mortgages etc.

The profit of Insurance Companies is derived from (1) the experienced mortality being more favourable (i. e. the deaths being fewer and occurring among persons who have paid a large number of premium) than was anticipated. (2) The rate of interest realised on the funds being greater than what was expected. (3) The expenses, proportionately to the amount of business, being smaller than what were provided for. (4) Lapses, i. e. persons ceasing to pay their premiums and losing the benefits of life assurances; while the amount they have already paid is forfeited to the Company. (5) Surrenders, i. e. persons ceasing to pay any further premiums and giving up their policy in return for only a part of the premiums they have paid; so that the remaining part of the premiums paid by them accrues to the Company. (6) Miscellaneous; such as assignment fees, fines etc.

The total profit, when declared as such, is distributed among shareholders and policy-holders, the former generally receiving one-tenth of it. That part of it which is given to the policy-holders is called Bonus, being offered in three ways at the choice of the policy-holder: (1) Cash Bonus—where a certain sum is given in cash (2) Reversionary Bonus—where the sum assured is increased by a certain percentage without increasing the premium; so that the bonus becomes payable not immediately, but at the same time as the sum—assured. Obviously the amount of this bonus is much larger than that of the Cash Bonus; Reversionary Bonus is of two kinds,—Simple and Compound. In the Simple Reversionary Bonus system the bonus is always given as a percentage addition to the original sum assured. In the compound Reversionary Bonus system, the percentage addition is made to the sum assured including all previously declared bonus additions. For instance, if Rs 75 is the first quinquennial (five-yearly) bonus declared on a policy of Rs 1000 the sum assured becomes Rs 1075. After the next five-years, if the rate of bonus is the same i. e. 7½ p. c., in the Simple Reversionary Bonus system this will be calculated on Rs. 1000 only, while in the Compound Reversionary Bonus

system, it will be calculated on Rs. 1075. Thus the actual bonus addition in the former case would be Rs. 75 and in the latter case it would be Rs. $(75 + 5\frac{1}{2})$ i.e. Rs 80-10-0. The total sum assured in the two systems becomes Rs 1150 and Rs 1155-10-0 (In order to avail oneself as fully as possible of the benefits of insurance, one should never take the bonus in cash) (3) Bonus Reduction of Premium:—Where the sum assured remains unincreased but the premium payable hence-forward is made smaller. This choice is not offered by many Insurance Companies and those companies who do offer discourage this way of utilising the bonus.

Bonus is always declared at the time of the Valuation, which is generally performed every five years or every three years, but mostly every five years on account of the great expense and trouble of a Valuation and also in order that the effects of any occasional fluctuation should be distributed over a large period. If death takes place between two Valuations, an Intermediate Bonus is allowed for the years elapsed since the last Valuation at the same rate as that of the quinquennial Bonus last declared by some Companies, and at a smaller rate by others.

Before proceeding further it would be better to explain what a Valuation is. A Valuation means finding the values of the policies of a Company which are in force. A policy is both an Asset and a Liability from the point of view of a Company, the element of liability being always greater than the element of asset. A policy is an asset in as much as a certain amount is due to be received (in the form of Premiums) from the policy-holder; and it is a Liability in as much as a certain sum is due to be paid on the happening of some event (death or attaining a certain age). The liability is greater than the asset, because, out of every premium received, some part is used up towards expenses and current claims and most of the remaining part has to be reserved to accumulate, so that the total amount becomes equal to the sum assured when this becomes payable. In order to find out this amount which must be reserved it is necessary to calculate the value of the liability element and the asset element of a policy separately. The difference is the Net Liability and as such has to be reserved. To calculate the liability element, it is necessary to find out

when the sum assured is likely to become payable so that the present value of the amount is the liability. For the asset element we must know how many premiums are likely to be received. To explain this still better we shall take our previous illustration viz. 4 persons out of 100 dying in the first year, 5 dying in the second year, 6 in the third, etc. Let us consider the values of the Liability and asset elements at the commencement of a policy (Eondoment Assurance 5 years). Then for valuing the liability it is assumed that $\frac{4}{100}$ of the sum assured will become payable at the end of the first year, $\frac{5}{100}$ at the end of the second year, and so on. The total of the present values of $\frac{4}{100}$ payable at the end of the first year etc. is the total present liability. Similarly we calculate the value of the asset element. The total of one premium received now and the present values of $\frac{5}{100}$ of the premium receivable at the end of the first year, of $\frac{4}{100}$ of the premium receivable at the end of the second year, of $\frac{5}{100}$ of the premium receivable at the end of the third year etc. is the total present asset. The fewer the number of years remaining before the sum becomes payable, the greater becomes the liability element and the smaller becomes the asset element; and hence the Net Liability, which is the excess of the former over the latter, goes on increasing rapidly. Finding the total Net Liability for all policies in force on the books of the Company is called a Valuation which involves the use of Mortality and Interest Tables. An expert in these calculations is called an Actuary. (He is thus the proper person to construct tables and Premium Rates) The Net Liability found out by the Actuary has to be reserved out of the funds in hand, and the balance, if any, is then utilised for distribution as profits. If on account of greatly expensive management, or large financial losses, or unexpectedly heavy mortality, the funds in hand, though apparently large, are less than the Net Liability found as above by the Actuary, the Company is said to be insolvent (unless the unpaid share capital is sufficient to cover the deficit). The Net Liability is generally called the Reserve, because so much amount has to be reserved for future payment. As in calculating Premiums, the Actuary has to use considerable discretion in determining what Mortality Table and what Rate of Interest shall be adopted as the basis of a

Valuation. The Actuaries have therefore to investigate from time to time how far the Mortality Tables constructed in the past have justified their adoption and to prepare new Tables based on the most recent experience and constructed by the most up-to-date scientific methods. To do this efficiently it requires a greatly organized effort on a large scale which is undertaken from time to time by the Institute of Actuaries of London and the Faculty of Actuaries of Edinburgh. According to the Insurance Companies' Act, the Valuation of an Insurance Company must be performed every five years and the results certified by a qualified Actuary. The qualifications conferred by only the above two Institutions are recognised by the British and Indian Governments. Though it is not enacted what Table of Mortality and what Rate of Interest should be assumed by an Actuary, the Actuary is required to report to the Government as to what bases he has taken for his valuation and what methods he has followed; and as these reports are published by the Government, a check is thus created upon the discretion of the Actuary. It would be interesting to consider the Valuations already performed by Actuaries of Indian Companies; but as it would necessitate discussing the characteristics of different Mortality Tables and the relation of the Rate of Interest to the Money Market, I shall not go into the subject. I may briefly mention however that the Rate of Interest assumed in the recent Valuations of Indian Companies varies from $3\frac{1}{2}$ p.c. to 4 p.c. and the Tables of Mortality generally adopted are the O^M or $O^{M(s)}$ with or without an addition of 5 to 7 years to the age. It may be mentioned that the higher the rate of interest assumed, the smaller comes out the Reserve or Net Liability. It may be similarly said in general (though this may be incorrect in some cases) that the better the mortality, assumed for Valuation, the smaller comes out the Reserve. A smaller Reserve means a larger surplus for distribution as profit. A part of every future premium, being required for future expenses, cannot be considered as an asset and hence it is necessary to adopt for the valuation only a part of the Premium, this being

called the Valuation Premium and to leave the balance untouched, calling it 'Loading Reserve for Future Expenses'. The percentage of such premium reserved in the recent Indian Companies' Valuations varies from 6 p.c. to 28 p.c.. The question of what percentage of premium should be reserved for expenses is one giving rise to great difference of opinion, inasmuch as this question depends for its solution upon a number of conditions which might be judged differently by different Actuaries in point of importance. The expenses made on New Business of every Company are very high generally, swallowing up almost the whole of, or sometimes more than, the first Premium. Hence the percentage of expenses to premium income depends largely on the proportion of New Business to the total Business on the books. Another point is the total amount of business; an increase in the amount of business does not involve any proportionate increase in the office expenses. Hence there is much room for difference of opinion. The assumption, for future expenses, of a very low percentage, however, such as 6 to 10 per cent. cannot be justified unless the first year's expenses have been very small indeed and unless the renewal commission also is very small. It is usual in a Valuation so to arrange that a large part of the first year's heavy expenses are to be recovered from all the subsequent years' Premiums. Hence usually the 'Loading Reserved' for future expenses is generally more than 20 p.c. of the premiums, particularly in the case of plans with a moderate number of payments of premium.

One part of a Life Assurance Company's business is to grant Annuities. Life Annuities are not very popular in India but they are common in the West. A certain lump sum is to be paid to the Company, in return for which, the Company binds itself to pay to the annuitant a fixed amount every year (or at shorter periods if so arranged) so long as he is alive. The younger the annuitant the more likely is he to live, and the larger is the lump sum he has to pay to the Company for purchasing the annuity. No return is made however if the annuitant dies early, because a balance has to be created between those who die early and those who live very long.

IS MUSIC A UNIVERSAL LANGUAGE ?

BY MARGARET E. COUSINS, BACHELOR OF MUSIC OF THE ROYAL
UNIVERSITY OF IRELAND.

IN a vague way the idea is prevalent that, whereas the languages spoken by different races all over the world constitute an obstacle to mutual understanding and exchange of ideas, in music is to be found a medium of expression which will override all the barriers of speech, and which will appeal similarly to all peoples ; in short, music is generally thought of as a universal language.

No better illustration need be given of how far from that this idea is than the story current about the Shah of Persia's visit to a London concert. By mistake he arrives before the hour appointed for the concert, but in time to hear the preliminary tuning up of the thirty violins, numerous cellos, clarmets, brasses and many other instruments which combine to form the orchestra. When the din of tuning ceased he turned to leave saying he had enjoyed the concert music immensely ! And truly so great is the gulf fixed between certain types of music that he probably had found more affinity between the chaotic mingling of disconnected sounds and his Eastern taste in music than he would have discovered in the finished concert performance in the Western mode.

Yet the experience of the recently held All-India Conference of Music at Baroda showed that, despite differences of vernaculars which prevented the musicians gathered together from all quarters of India from enjoying verval interchange, in their musical performances they had a common language of emotion similarly understood by all. The same holds good with regard to Western music, which produces the same effect on its hearers, be they French, Russian, or German, or English. Thus it is undoubtedly true that within certain bounds music has the characteristics of a universal language. Yet if the Baroda musicians and European musicians had played and sung to one another the certainty is that they would have bored one another to death, failed

to understand one another, and had their faith shaken in the idea of music being a universal language.

The sounds used as the material of music are practically the same everywhere, but in the development of the art of combining sounds in ways which through custom have become pleasant to the ear, such divergences have occurred as cause one at first almost to despair of ever bringing about a "rapprochement" between the musical conventions of East and West. An examination of the many points still, however, held in common, and the renaissance of Indian self conscious interest in music will, nevertheless, show that the gulf between the two great systems may still be bridged and the universality of music's appeal become an established fact.

In the East, the 12 swaras, in the West the 12 semitones within the octave, represent the same sounds and form the basis of all music. The art of singing is common to both systems, though the methods of voice production vary : The tonic-solfa notation of the West or method of writing down the names of sounds, is similar to the Eastern notation. The desire to express and convey an emotion to another is the aim of singing in both hemispheres, its effect being reinforced by accompanying instruments. Both systems contain beautiful melodies, repeated with embellishments, in the West known as "Airs with Variations," in the East as "Ragams." Both systems sprang from a common origin lost in the mists of time, and travelled along the same paths of development right up through Grecian times and Grecian influence till the 11th century, so that the old church music before Pope Gregory's time is similar in its general character and its bourdon bass to much of the Indian music of to-day with its single-string sustained-note accompaniment, while the Scottish bag pipes

might even be mistaken for certain Eastern instruments—so alike are they.

The end of the Middle Ages saw the beginnings of great changes in Western music. From experiments in causing the drone accompaniment note to follow the melody instead of remaining fixed the whole system of musical harmony arose and proceeded so rapidly by the aid of mechanical improvements in the construction of new musical instruments that now the distinguishing feature of Western music is its reliance on harmony, whereas harmony is conspicuous by its absence in Eastern music. "It is the pride of Indian music that it is the same as it was centuries ago, yet that is an evidence of stagnation rather than of life, for change is a law of life in any sphere. During these centuries Eastern musicians have used their energy in the classification of existent, rather than the creation of new musical forms; in tabulating mathematical laws underlying the elaboration of the old *ragas* rather than in soaring to fresh flights of song, fancy-free.

The resultant is the amazement of the Eastern musician when to his first question "How many *ragas* have you?" the Western answers "literally innumerable;" and the equal astonishment of the latter at the statement that the Indians have 1440 *ragas* well-known to professional musicians! With the one every fresh composition is an original production built upon one of the two scales only used in modern music; with the other though the scales are more numerous, no fresh *ragas* are now possible.

So also one remembers the amazed delight of an Indian singer of culture on hearing a simple vocal quartette by western amateurs, when for the first time he discovered how consonant sounds at different pitches sung together enriched the melody and produced a new effect.

The West has exhausted the resources of the two scales or modes to which it had limited itself as its vessels of musical exploration. The only hope of further expansion is through a growing knowledge and use of the many Eastern scales in daily use, as the bases of the 32 *Melakartha ragas*. In exchange, the East should experiment in harmonising their *ragas* and in widening their form. Greater mutual knowledge would disprove the Western idea that all Eastern music is monoto-

nous, and the latter's delusion that Western music is disconnected, abrupt, discordant and formless.

The great difficulty in the way of exchanging knowledge is absence of a method of expressing sounds on paper common to the two systems. Some musicians at the historic Baroda Conference considered that Gramophone records would act as the future method of writing music, but these will never help the study of the construction. As the art of Indian music develops—for expand and change it must—some different method of musical notation will become imperative. That used in the West can cover every sound used in Indian music and if only it be adopted there will be every chance of interchange of musical knowledge, to the mutual enrichment of both the great divisions of music.

That the Eastern notation could not meet the needs of Western music is proved by the fact that the latter discarded its own Tonic-Solfa system as India has incorporated the terminology of Western science in its vocabulary; it will soon realise the desirability of learning also and using the more concise system of Western musical symbolism. Then only will the way be opened to share with the world the secret of Eastern music contained in its intense subjectivity, one-pointedness, harmonious adjustment to times and seasons, and belief in the Gandharvas.

Modern music is democratic in essence. It aims at the greater good of the greater number. Its method, of combination rather than unity, increases the area of pleasure and happiness in the world. It is the exponent of God in the Many, whereas ancient music used its voice as the path of sound leading to ecstatic union with its source, it sought God in the One, and aimed at liberation from the world, rather than improvement of conditions of the world.

Both ideals are true and necessary, and eventually by their fusion a greater system of music will evolve which will be their synthesis. Written in symbols common to all countries, using basic scales to which the hearing of all people will have become accustomed, this music of the future will become so capable of world-wide appeal as truly to merit being called a universal language.

MADAME OF THE SECOND FLOOR

BY WILLIAM LE QUEUX,

Author of "The House of Whispers," "The Invasion," &c.

[All Rights Reserved.]

I CLIPPED my heels together, and bowed low over the gloved hand of the stout Countess von Wahlstalt, being afterwards warmly greeted by her white-bearded husband, the German Ambassador, as I entered the great ball-room of the Embassy in the Rue de Lille.

All the monde of Paris seemed to have assembled there, while we of the diplomatic corps made a brave show, with our gold-braided uniforms and glittering decorations.

Shorn of its tinsel and trappings, our fast living, intriguing little world of diplomacy—that world which revolves around the thrones of Europe—would be a sad and sorry circle, each member of it struggling for love, favours, supremacy, or secret knowledge of political undercurrents.

Our own staff from the Rue de Faubourg St. Honore were all there, from Lord Ashthorpe, the Ambassador, down to the youngest attache. Monsieur le President was present, wearing the crimson riband of the Legion d'Honneur, and with him several Cabinet Ministers and many officials with their chattering and often commonplace women folk.

The balls at the German Embassy were always among the smartest functions in Paris, the residence of the representative of the Kaiser, with its spacious salons and wonderful cut glass chandeliers, being admirably adapted for entertaining upon a lavish scale. The orchestra was playing one of Strauss's most tuneful waltzes, and the scene was a perfect kaleidoscope of colour, the gowns of smart Parisiennes contrasting artistically with the brilliant uniforms of the men who were serving their various sovereigns abroad.

As I strolled forward I noticed Gerald Ramsden, one of our attaches, seated with Stella Mansfield, a pretty, dark-haired, sweet-faced girl in a simple but extremely effective gown of pale carnation chiffon. Truly they were a very handsome pair,

and every one in that white-and-gold salon knew how intensely they adored each other. Gerry was one of my particular chums, for we had been up at Oxford together, had entered the diplomatic service in the same year; and while he had served at Rome, Lima, and the Sublime Porte before being appointed as attache to Paris, I had led a wandering and somewhat adventurous life, moving backwards and forwards across the face of Europe as a member of the British Secret Service.

I halted before the pair, and, bowing, paid my respects to the daughter of the great Sheffield ironmaster whose wife preferred the cosy flat on the second floor in the aristocratic Rue Bayard for the greater part of the year, to the big country mansion in Northamptonshire, or the mediæval castle and shooting which her money-grubbing husband had recently purchased in the Highlands.

Stella had been in London for three weeks, and Gerry had been daily at my apartment, inert and disconsolate. Without his well-beloved, he was nowadays always at a loose end.

Only that morning had she returned to Paris, therefore I welcomed her, telling her how Gerry had been visibly pining for her return.

"You really are too bad, Mr. Verrier," exclaimed the pretty girl, pouting and raising her sequin fan threateningly. "You are too fond of chaffing us. I don't know why we should be the laughing-stock of everybody."

"Because everybody is jealous of your mutual happiness," I said with diplomatic endeavour. "But I see your step-mother yonder with the Belgian Minister. I must cross to speak with her."

"Don't," urged the girl. "I'm—well, I'm rather cross with mother. She's vexed me to-day very much."

"I'm sorry for that," I said. "How?"
"Something she has said—something

which need not be repeated," replied the girl, whose annoyance had become the more marked, evidently surprising her lover.

"Never mind," I laughed. "Gerry will quickly put matters right. Your step-mother is awfully fond of him, you know."

The girl was silent, her dark brows knit very slightly. I saw that Gerry regarded her with a distinctly puzzled expression.

"Who is that young fellow speaking to her now?" I inquired, as a tall, dark-haired man, rather foppishly dressed, and wearing a gold-rimmed monocle, stood with his gloved hands behind his back as he bent to laugh with the elderly, well-dressed Englishwoman who for the past three years had been so well known in the best society in Paris.

"Oh, only one of mother's new friends," replied the girl. "His name is Somers."

"English, then?"

She nodded in the affirmative, and leaving the happy pair I was at once button-holed by Galli, the Italian councillor of Embassy, who had a tit-bit of scandal to relate concerning a fracas on the previous night at the Travellers, and an impending duel as result.

The ball differed in no respect from the dozens of similar functions where we of the diplomatic corps are compelled to be on show. In my capacity of secret service agent, I kept my eyes and ears well open, for there were at that moment strange and rather absurd rumours regarding an entente between Italy and France, and at Downing Street they were thirsting for information concerning the exact position of affairs.

I had a couple of dances with the Marchesa Spinola, the dark-haired, well-dressed wife of the Italian Ambassador, and just before two o'clock drove back to my apartment in the Boulevard Periere.

I had taken off my uniform, and in the ease of dressing-gown and slippers was enjoying a final cigar before turning in, calmly reflecting upon certain political information I had gathered that evening, when suddenly Gerry, pale-faced and agitated, burst into my room.

"It's all over, Jack!" he exclaimed, sinking into an armchair. "My engagement with Stella is broken. I—I—" And his voice trembled with emotion.

"Broken!" I gasped, staring at the

poor fellow. "How? Tell me all about it."

"I left before you did, and drove home with Stella and her mother. On arrival Mrs. Mansfield expressed a wish to speak with me alone. I followed her into the petit salon, where calmly and deliberately, she told me that her husband and herself had decided that my means were insufficient to provide properly for Stella, and that therefore they withdrew their consent to our marriage. I—I was staggered," he said in a hoarse whisper. "I ran to Stella, but she only burst into tears. She made no protest except to declare: 'I will never marry that man Somers—never!'"

"Is there some suggestion of her marrying that fellow, then?" I asked quickly.

"Yes. Stella afterwards admitted to me that her step-mother had that morning on her return from London told her plainly that Somers had asked for her hand, and that both her father and herself had consented."

"But surely Somers is quite a new acquaintance!" I exclaimed.

"The Mansfields have decided that he is to marry Stella," cried the unhappy fellow. "What am I to do? That woman is my enemy. She has been all along. But I will defy her. I will marry the woman I love!"

He seemed beside himself with grief and anger. I tried to console him, but without avail, and presently, with a fierce imprecation against Mrs. Mansfield, he went forth again. From my balcony I watched him until he had disappeared along the silent boulevard.

Then I sat down and wondered what strange reason there could be for Mrs. Mansfield's curious decision.

Next day I saw nothing of Gerry, and the following day I was out at Versailles with two English cousins and did not go down to the Embassy. We lunched at the gay Hotel des Reservoirs, and spent some hours viewing the ancient splendours of the Palace. It was not before seven o'clock that I returned to the Boulevard Periere.

While dressing for dinner, Jules, my man remarked:

"That affair in the Rue Bayard is a very strange one, is it not, m'sieur—the mysterious murder of an English lady?"

"Murder!" I exclaimed. "What, Apaches again?"

"No, m'sieur. A lady named Mansfield

was found by a servant shortly after twelve o'clock to-day in her apartment, stabbed to the heart."

I started, too amazed to utter a word.

"Here is the newspaper," Jules said, as he placed the journal in my hand.

In breathless eagerness I scanned the brief report it contained, and learnt that at half-past ten o'clock Mrs. Mansfield's daughter, Stella, had gone out to the Rue de Lubeck for her painting lesson, and half an hour later the man-servant having gone out upon an errand and the cook being away making her morning purchases, as is the habit in Paris, Mrs. Mansfield had despatched her maid Clotilde with a note addressed to a certain Monsieur George Somers, staying at the Hotel Ritz, in the Place Vendome.

The maid, on returning, had opened the door with her latch-key, and was in the flat fully twenty minutes before she made the ghastly discovery that her mistress was lying dead behind the door of the *salle-a-manger*, having been struck down by the hand of an assassin. The room was in disorder, and some antique plate was missing. The girl had raised the alarm, the police had been telephoned for, and Monsieur Bottin, the famous Chef du Surete, was already making the most exhaustive inquiries.

I took up my telephone instrument and got through to Gerald Ramsden's apartment in the Rue de Varenne. I recognised the voice of Pierre, his servant, who responded.

"Monsieur left this morning at eight o'clock—for London, I believe. He said he should be absent a week. I am sending his letters to his club in London," the man said in reply to my inquiry.

From Jackson, who was on duty at the Embassy, I could gather nothing definite. Gerry had not been there that day.

This caused me to wonder. Why was he absent from his post without leave of the Chief?

An inquiry over the telephone to the flat in the Rue Bayard elicited no reply. The place was, of course, in the hands of the police.

I went forth to find Stella, and after several hours of inquiry discovered her at the house of Madame Bouchard, a friend of her step-mother.

The police had already closely questioned her, it seemed. But beyond what was in

the papers she knew nothing. I made inquiry concerning Gerry, but she was too upset to be inclined to talk. Indeed, her thoughts were, I knew, running in the same direction as my own. It was, to say the least, a suspicious circumstance that he should have gone to London without first obtaining leave of absence.

I recollected those dark threats he had uttered against the woman who had stood between him and happiness, that frenzy of madness which has seized him, and his intense jealousy of George Somers.

Next morning the Paris papers were full of "The Affair of the Rue Bayard," and having on more than one occasion in my capacity of secret service agent met the great detective, Jules Bottin, I called upon him at noon at the Prefecture.

The stout, round-faced man in gold pince-nez was instantly interested when I explained that I had known the dead woman.

"The affair of the Rue Bayard is certainly very curious," he said. "The motive of the murder was revenge—not robbery. To me it seems quite plain that Madame Mansfield purposely sent out the servant because she wished to receive some visitor in secret. That visitor came, and——"

"He killed her," I said.

"How do we know? She may have been killed after her friend left."

"I see by the papers that she sent a note to a man named Somers, at the Ritz," I remarked.

"Yes. Here it is," and he placed before me a note in the dead woman's well-known hand—a few scribbled lines which read:

"Dear George,—I spoke to both Stella and Gerald last night. Their engagement is broken. Soon you will be my son-in-law, and then I shall congratulate you. Keep away from me for a few days, as your absence will obviate unpleasantness. Au revoir, MAUD MANSFIELD."

"And where is Somers?"

"In Paris—under observation. Your friend and colleague, Gerald Ramsden, had every motive to be incensed against the dead woman. He has left for London—he left Paris at noon—half an hour after the affair—and not by the 9.50 from the Gare du Nord, as his man supposes. You see," said Bottin, smiling in triumph through his glasses, "I have not been idle, M'sieur Verrier!"

"Then to put it plainly, you suspect my friend?"

"It is more than suspicious. Yesterday morning, soon after half-past six, Ramsden met Stella Mansfield clandestinely in the Avenue des Champs Elysees, at the corner of the Avenue Marigny. He told her something—something which she refuses to divulge."

"And you have telegraphed to London, of course—if your suspicion is so strong," I said bitterly, for the regrettable affair would cause a terrible scandal throughout our service.

"Two of my agents left for London by the four o'clock train yesterday. They arrived there last night."

"I'll not believe Gerry to be guilty of murder!" I cried. "That woman treated him badly, but he was not the man to commit such a cold-blooded crime."

"Probably it was committed in hot blood. I have ascertained that he was furious and beside himself with anger on the night before."

Then, controlling my feelings by dint of great effort, I related to the famous detective what had occurred at the German Embassy, and its curious sequel.

"Now," I added, "who is this stranger George Somers, and why should he so suddenly desire to marry a girl he has hardly ever seen?"

Bottin slowly stroked his beard. Then, in silence, he removed his pince-nez and polished them with his handkerchief.

"Yes," he admitted at last, "there is certainly some mystery about him—and depend upon it, Monsieur Verrier, there is more in this curious affair than at present appears."

"But you suspect Gerald Ramsden of the crime?"

"Most certainly. While Somers had everything to gain by the lady's friendship, remember, your friend Ramsden had everything to gain by her death!"

Such an argument I could not refute. As Bottin was just going round to the Rue Bayard in order to go through Madame's papers and effects, I begged leave to accompany him. I knew the flat well, a handsome apartment, luxuriously furnished, as became the Paris residence of a man worth at least a million sterling.

As we entered the large drawing-room I saw, upon a side table, a cabinet portrait of Somers in a silver frame. There was another in the fumoir; therefore I begged the loan of the latter and placed it in my

pocket. Suspicion had fallen upon Gerry, and it was my duty, as his friend, to save him if possible; indeed, at all hazards to prevent a British diplomatist being arrested for murder.

During three hours Bottin, aided by two of his agents, made careful investigation of every scrap of paper to be found in the place. Mr. Mansfield had been telegraphed for from Sheffield, but a reply had been received that he had unfortunately sailed from Liverpool for New York on business only the day before.

By the mail that night I left the Gare du Nord for London, and next morning found Gerry at his brother's rooms in Bruton Street.

When I approached the distasteful subject he remained pale and silent. His face was haggard, his eyes showed signs of sleeplessness, and he was restless and greatly agitated. He related how on the previous day he had been followed everywhere by two detectives.

"Look here, Gerry," I said when we were alone, "the police know that early on the morning of the tragedy you met Stella at the corner of the Avenue Marigny, and that you told her something. What was it?"

"I told her a secret—a secret that I had learnt the night previously."

"Of what?"

He hesitated for a second, then replied:

"No. I—I really can't tell you, Jack. Please do not ask me, I beg of you."

"That fellow Somers is the assassin, is he not?" I asked in a low, strained voice.

"No," he answered hoarsely. "The fellow may be a low blackguard, and worse, but—but he—he did not—kill Mrs. Mansfield. He must not be arrested. You understand, Jack—" he cried wildly. "You understand my meaning?"

I nodded. My heart was too full for words.

I left the house utterly dumbfounded. My friend's wild words rang in my ears. Bottin's surmise was correct!

What could be the nature of that secret which Gerry had refused to reveal to me?

In sheer desperation I took a taxi down to Scotland Yard, and was fortunate in finding my old friend, Inspector Taylor of the Criminal Investigation Department, in his office.

"Yes," he said, when I had explained the object of my visit, "we have been much interested in that Paris mystery. The French

police have not consulted us, or we might have placed quite another complexion upon the affair."

"How?" I gasped eagerly.

"The murdered woman sent a note to a certain man named Somers before she was killed—according to the 'Matin.' Now if that is the same Somers, I happen to know him well."

"Here is his photograph!" I cried, taking the picture from my pocket.

"Yes," he said slowly, as his eyes fell upon it. "The explanation of Mrs. Mansfield's sudden anxiety for this man to marry her step-daughter is not very far to seek. Seven years ago I arrested at Norwood Maud Thurston, as she was then, and George Somers, an engraver, for the ingenious forgery of French hundred-franc notes. The woman was sentenced at the Old Bailey to two years' imprisonment, while he, an old offender, got nine years. When she came out she apparently married Mansfield, who was a widower, his daughter Stella being then at school in Lucerne. Mrs. Mansfield preferred Paris, where she was not known, to London, where she might perhaps be recognised. Somers was released on ticket-of-leave six months ago, and no doubt went to his former associate, suggesting that if she would bring about his marriage with Stella he would keep a still tongue. Mrs. Mansfield would naturally be compelled to submit, and so keep her husband in ignorance of the truth."

"And who killed Mrs. Mansfield?"

"Your friend Ramsden. He somehow learnt the truth, and in a frenzy of hatred against the woman who had been to prison, and who, in order to shield herself, would sell her husband's daughter, made a secret appointment and struck her down," Taylor replied. "Bottin, over in Paris, will find I am correct," he added. And just then the telephone-bell at his elbow rang, and he received an urgent call to the other end of London.

I returned to Gerry, and told him what Taylor had said.

"Yes," he replied in a low hoarse voice, "it was that secret which I had learnt. A man, an ill-dressed Italian, was awaiting me outside my rooms on my return from the Embassy the night before last, and told me the amazing story. At first I thought him mad, but——" And he hesitated.

"And you told Stella on the following morning—eh?"

He nodded in the affirmative, his haggard countenance blanched to the lips.

"Look here, Gerry," I said, standing astride before him. "Stella knows who killed Mrs. Mansfield. She was there—in the apartment."

"How do you know that?" he gasped, starting and staring at me as though confronted by an apparition.

"By your own attitude," I said quietly. "Stella knows the truth. Why will she not speak? She must!"

"You will never obtain the truth from her, because—because——" and he whispered in a voice so low as to be almost inaudible—"because of me! She—she still loves me—ah! yes, Jack—we still love each other."

I was silent. The hard-set face of the man before me held me speechless.

"This mysterious Italian—who was he?" I asked at last. "What did he know?"

"Everything."

"His name?"

"His real name was Thurston—he was her son, born and bred in Italy. She had discarded him years ago. Then he had molested her, and upon her false testimony he had been sent to prison."

"And he has had his revenge!" I cried. "It was he who exposed her to you—he who went there next day, and killed her."

"I did not tell you that," he said very calmly. "He told me the truth, Jack, but I have not betrayed him, neither has Stella—who returned unexpectedly and actually saw her step-mother struck down."

"Ah!" I cried in relief. "Why have you led me to suppose that you, my friend, Gerry Ramsden, was an assassin?"

"Because I refused to betray the man who had, by his information, given Stella back to me," was his calm reply. "On that fateful morning I went to the Rue Bayard in order to face the infamous woman—to defy her. But on arrival at the door my ring remained unanswered, and I turned away, never dreaming that Stella had just slipped out, horrified, having stood beside her step-mother—lying dead. I knew that Mrs. Mansfield had a secret appointment with her son, but I never anticipated such a tragedy. I left Paris because—because I feared that some unfortunate circumstance must arise—because——"

"And her son? Where is he?"

"If Bottin goes to his lodgings in the Rue Bague, number fourteen, he will find him dead. See, I had this note from him, sent me by Pierre, this morning." And he showed me a dirty scrap of paper which left no doubt that the assassin had taken his own life.

Half an hour later I telegraphed to Bottin, and at seven o'clock that same night received a response that the body of the murderer of Madame Mansfield had been discovered.

The truth concerning the affair has

never been made public until now, and Mr. Mansfield, a most estimable man, has happily never learnt the infamy of the woman who had become his second wife.

The ex-convict Somers swiftly disappeared into oblivion, fearing another charge which Inspector Taylor held against him, while last April Stella and Gerry were happily wedded at St. James's, Piccadilly, he having been transferred as second secretary to His Majesty's Embassy to the Court of St. Petersburg.

THE BURNING GHAT

IT was a glorious summer evening. The air was full of the sweet smell of flowers and the song of the birds. Everywhere was calm and quiet. The leaves on the trees quietly whispered to each other as the gentle breeze stirred them, the grasshoppers hopped merrily about, the moths fluttered gently by with the breeze, intent on making the most of their brief existence. Here and there a stray squirrel whisked by with a great flourish of its bushy little tail, as if ashamed of being seen out so late, and all the world seemed peaceful and at rest.

How beautiful! I said to my companion—how beautiful it all is! We were standing in the shade of a magnificent oak tree which spread out its branches like great arms as if to protect all the world. There seemed a strange hush over everything, an expectant hush as if the world were waiting for something that did not come. Listen! I said to my companion. In the distance, far away there came a sound of

singing, or rather chanting. Nearer it came, and as it drew closer the more grand and thrilling became the singing until my whole soul seemed to respond and I stood as one transfixed.

Then I looked and in the distance was a little body of men, walking slowly with measured tread, still singing, and in the midst of them was something they carried on a stretcher, a something covered with the Union Jack. Slowly they passed the

Carrying the dead body of a wounded soldier to the burning ground.

place where I stood. Softly and musically tell the chant from their lips which gradually swelled in volume and feeling until again I felt that strange exultation and my whole heart respond to the singing. With bowed head and clasped hands the singers passed on—tall Sikhs broken in the war. Some could only limp along. Others had their arms in slings or alas an empty coat sleeve pinned to their side, but all passed along towards the little building in the distance, where their friend and comrade who had succumbed to his wounds, would receive the last rites of his religion.

The building was more like a tent than anything else. In the middle of it a stream had been made which was full of running water, and over this the funeral pyre had been built. Quietly the little procession drew near, and then from underneath the Union Jack—the flag he had served so nobly and so well—the body of the dead warrior was taken and reverently placed upon the pyre.

Around the pyre the little company gathered with clasped hands. I noticed the look of exultant pride which seemed to flash from their eyes as they gazed at the recumbent figure on the pyre. There was no selfish grief depicted on the faces of these

The dead body has been brought to the burning ground.

splendid warriors, rather it was a look of gladness, of pride, that their friend should have died in such a cause and in such a way. Truly these men are marvellous, was the thought that flashed through my mind while my own eyes grew misty.

The wisdom of the East is often beyond the comprehension of the West. But they were singing again—and this time something grand and stirring, which sounded to me like a battle march, and then a mournful chant in which they seemed to bid him farewell. Then from the group advanced a tall handsome Sikh, and taking a taper, he lighted the pyre, whilst the rest stood around with hands clasped as if in prayer. Quietly they stood like statues while the smoke curled up and the flames ate away the wood.

Last rites being performed on the burning pyre

It was a strange sight, a weird sight to me and my heart felt like bursting as they turned away and slowly disappeared in the distance. The tears filled my eyes so that pyre and smoke and everything else was blurred and indistinct. A great sob rose in my throat when in the distance again I heard that chant—so grand, so exultant, so full of hope and gladness—that my tears were swept away and my soul was comforted. But the music of that chant still lives with me—a sweet solace in weary workday hours, and a grand inspiration in wakeful nights—and although the incidents connected with it were so sad, yet I would

Dead body of a wounded soldier burning

give much to hear that chant again, sung by those broken warriors in the calm and quiet of a summer evening.

EVA WILLIS.

GLIMPSES OF LIFE IN THE LAND OF PAGODAS

BY MANILAL MADHAVLAL PURANIK.

THE life in the Silken East with its luxuriant foliage and abundant supply of water of the Irrawaddy is very charming. No sooner does a stranger set foot on the land of Burma, than he naturally becomes keenly interested about the people of the land. The dress and the manners of the Burmese people at the outset creates a favourable impression on the foreigner. Much unlike in India. Burmese women here do take a prominent part in the dealings of the land. Despite the facts that the Burmese Buddhists make no provision for the elementary education of girls there is more equality between the sexes than among other Eastern races. Indeed in many respects the women in Burma enjoy freedom and independence far ahead of what as yet prevails among Western Nations. To call a woman the "weaker vessel" would indeed be a misnomer. The wit and intelligence of

Burmese women are decidedly above the average of those of men. Their capacity for petty trades and even for concerns of greater magnitude is so well recognised that even the words of Burmese female traders are equally valuable just like the written documents.

The burmese birth customs are more or less identical with those of ours. On the seventh day of the birth of a child the name giving ceremony is performed. This is fixed after consulting the horoscope prepared by the Phoongyi—the religious priest. The boys might be called Maung An, Maung Gauk etc., and girls be called Ma Gyi, Ma Shwe Mi, etc. The names thus given in infancy may as often be changed as desirable. Burmese people have no family name of their own. When they migrate to distant lands or tracts and found new hamlets there, they often bear the name of the village whence the

Shway Pagone Pagoda, Rangoon

An avenue of 729 pagodas, each containing a stone whereon are written verses from the holy books of Buddhism.

GAUTAMA BUDDHAS IN THE BINGYI CAVES.

Burma is noted amongst other things for its caves. The Bingyi group is the most interesting of the series.

colony was planted. In order to fix the identity of any individual it is therefore necessary to describe him or her in all proceedings as Maung Ka the son of Maung Lugale. The Burmese girl entering into the bonds of matrimony still retains her maiden name.

At about eight or nine years of age the happy time of unrestricted nudity and amusements comes to an end when the boy goes to the monastery to study. There the method of instruction is very simple. The boy is taught to read and write generally with a bit of elementary lesson in Arithmetic. After having spent a year or two in the monastery the small boy returns home again. He assumes at the age of twelve or thereabout a temporary "Yellow Robe" of an acolyte. The Shinpyu or ceremony of becoming an Acolyte is next to birth and death, and by far the most important event in any Burman's life. In comparison with this, such an event as marriage is a mere incident of much less significance. The idea of putting on the

yellow robe is to assume the garb of humility and to enter upon the life of mendicant poverty. After entering the Life of Poverty and Self-denial the Slim or Koyin continues his study in the Buddhist sacred writings. The education thus obtainable from about seven or eight to fourteen or fifteen years is certainly narrow and circumscribed. But it has this advantage that the proportion of literates to illiterates is as 487 to 513 according to the census of 1891. Phoon-gyis do evince a keen interest in teaching their pupils.

Every boy in Burma has to subject himself to the process of tattooing. This forms one of the ceremonies, the day for which has to be fixed after consulting the horoscope. The tattoo marks extend from waist to down below the knees. In addition to this regular adornment of the male person many other tattoo marks are often seen on the chest, back, arms, and elsewhere. Burmese girls are not tattooed. After receiving her name when about a fortnight old the first great and real event in the life

A PAGODA THAT ROCKS WITH THE WIND

The temple is called Sampan or boat pagoda on account of the shape of the rocking stone upon which it is built. The temple is situated 3,650 feet above sea-level and can only be reached from the parent rock by means of ladders

of a girl is the ceremony of Ear-boring, generally performed more commonly just before the attainment of puberty. The day on which the ear-boring ceremony is fixed is observed with greater gaiety and pomposity. The friends and relatives are invited in the usual manner, by means of sending round small packets of tea. Conversation and music while away the time. The girl on whom the ceremony is performed is gaily dressed and seated on a raised seat for the purpose. She is surrounded by her female relatives and when the auspicious time is announced the professional borers force the needles into the soft lobes of the ear and shrieks and screams are more or less drowned by the deafening music provided.

Until about the thirteen years the education of a girl is confined to household duties, general instructions in reading and writing coupled with elementary instructions in additions, subtractions, mul-

A Burmese Priest.

tiplications etc. To give a finishing touch to her education the Burmese girl has to maintain a stall in the market. There her naturally keen mercantile instincts and business capacity is given a full swing. Burmese girls of nineteen or twenty is consequently much smarter than a lad of the same age. Greater care is bestowed by the Burmese girls on their personal looks, than an average Indian lady. The bark of a sweet scented wood called 'thantka' is rubbed down in fine with water and is applied all over the body. After being rubbed it is smeared over the face and then allowed to dry. This affords a polishing touch to the skin and makes the appearance rather attractive. Her long black hair, glossy and lustrous with cocoa-nut oil brings her toilet to an end.

All love affairs are conducted in strict accordance with ancient usage and custom. The bachelors in the evening form a company under the leadership of one and

A Burmese Festival.

meet at a fixed place. As they take the round of the village the lads drop off either singly or in twos and threes. The lovers make some sort of signs before they venture to go up where their beloved ones live. This certainly has the tacit approval of the girls' parents. A public form of courting is the attention which may quite correctly be paid to girls keeping stalls at a night Bazar.

When the boy has made his choice of his sweet-heart, he informs his parents of the same; who accompanied with relatives and elders of the village make a formal demand of the girl in marriage with his son. The terms of the betrothal are settled i.e. (dowry and jewels) and the contract lasts for a period of three years. A day is fixed for the marriage. The main ceremony consists in joining the hands palm to palm at the moment prescribed as auspicious, in eating out of the same dish, in placing morsels of food in each other's mouth in token of their vow to love and to cherish each other. While the festival is being kept up in the evening, the young couple retire to the bridal chamber amidst showers of saffron-dyed-rice and remain there in seclusion for seven days. The old customs have in course of time somewhat altered and the

period of betrothal has become much shorter. The marriage in Burma is purely a civil contract and as such there is vast liberty for divorce.

The death of any one member of a family is of course cause for sorrow in other countries but in Burma the funeral ceremony, like all other religious rites, is somewhat of the nature of a festival. As soon as convenient after the death the corpse is placed in the open front portion or verandah of the house. It is there washed and covered from chest downwards with snow-white cloth. The thumbs and toes of legs are either tied together with a cord made out of the hair of a son or a daughter or of twisted white cotton. Often too a small silver coin is placed in the mouth. The burial ground and crematory places are almost invariably situated to the west of any village or town. When the corpse has been nailed down into the coffin the priest renders assistance by reciting extracts from sacred writings regarding "Ancissa, Dokka, Annatta", i.e., impermanence, misery, and unreality. The bodies of the poorer people are disposed off the next day at the latest: The richer the deceased the greater is the delay in completing the obsequies and the more imposingly spectacular is the display connected with

the preparations and the funeral rites. Lest the solemnities partake too much of a festive nature professional mourners or weepers are sometimes em-

ployed. Cremation or fire-rites are much more common than burial rites among all the well-to-do classes. Wooden posts or brick monuments are sometimes erected

Burmese National Dance

Burmese Paddy Boat

over the bones of the deceased. Sometimes the bones are pulverised mixed with lac and saw-dust and formed into images of Gautama which are either placed in the sacred edifice or retained in the house. But such images are never worshipped in any way.

It has been frequently said that the Burmese are the Irish of the East. There are it is true various outstanding traits of character in common such as pride of race, love for laughter, amusements, light-heartedness, want of prudence etc. They are proud of their nationality. The Burmese consider the Chinese, Siamese and Shans as of the same stock as themselves. The Burmese are on the whole decidedly truthful and they are credulous and superstitious to a degree. Passive courage and high resistance they often maintain is the direct outcome of their religious philosophy and their belief in destiny being controlled by the influence of past deeds. Another characteristic arising mainly from their religion is marked tolerance. As a race the Burmese have no mechanical ability or inventive talent. Idiotic children are exceedingly rare in Burma but adult idiots and lunatics are regarded with much awe as being inspired. Burmese women exhibit marked modesty in all her movements. The behaviour of Burmans towards their womenfolk is habitually courteous and entirely free from anything like coarse familiarity. Gentle affection, kindly regard, benevolence and freedom from all kinds of desires are considered the four cardinal virtues. Burmans have a love for gambling which they have in common with their Chinese relatives.

While still an independent nation the Burmans were divided into seven classes. These consisted of the Royal family, the priesthood, officials, traders, cultivators, handicraftsmen, slaves, and outcasts. Priests and monks have always enjoyed special considerations on religious grounds, while officials formed the most powerful section of Society under the Burmese Rulers. Short of Royalty and throne, any individual other than the slaves and outcasts could rise to the highest position in the land. But slaves and criminal outcasts were entirely debarred from the rights of free-men. Grave-diggers, beggars, prostitutes and lepers are included among the social outcasts. The natural veneration for the Royal blood was extreme and amounted in fact to superstition. While

there are no caste distinctions, there is also no landed aristocracy, but there is nobility. To be appointed an official of the state was in itself practically of the nature of conferring nobility while merchants and large traders who acquired property were registered by royal edict as "rich-men" (Thute). The Burmans are naturally very polite. The respectful attitude before a visitor is to kneel down and draw the legs closely together. Among Burmans poly-

A Burmese Beauty.

gamy is permitted by law. The national dress is simple and very attractive. The man's waist cloth (Pase) is originally made eighteen cubits long and twenty and a half inches wide. The ends being folded back, it is stitched together forming a plaid nine yards long and one and a quarter broad which is tied round the waist. A white cotton or silk jacket is worn over the body down to the waist. A silk handkerchief in which the hair of the head,

nicely combed and arranged in top-knot, is enclosed, forms the head dress. The Burmese women do not cover the head but a handkerchief is loosely thrown over the shoulder.

Phoongyees or priests and Scholars of Burma.

where all sorts of things are available for sale at the spot. Pwés and dances and theatrical performances by amateurs are being held throughout the night. During the day the ceremony consists of offering

candles, flowers, fruits, burning of scented sticks before the images of Gautama Buddha and hearing the sacred passages read by Phoongyis. On the evening of the last day of the festival vast crowds dissolve with marvellous rapidity. By nightfall the spaces between the lines of booths so lately thronged with people are all but empty. Such pwés and dances are also being arranged for at the time of household rites such as naming of the child, boring of a girl's ears, the entry of a boy into his acolytehood at monastery and the funeral rites etc. These dances or pwés are always assisted by Burmese music parties.

Mirth-loving people like the Burmese cannot do without festivals and amusements. In fact every attempt is being made to celebrate a day of every Pagoda that may lie in the vicinity. Their way of enjoying and celebrating a festival is much commendable. The two great national festivals are those connected with the New Year which is generally called "The Burmese Lent." People from different parts of the province come and meet at the place of worship in their best. They take their abode temporarily in the bamboo-huts erected for the purpose.

These huts are erected around the pagodas and in such a way that when inhabited by beautiful damsels, lend an appearance of a village nicely laid out with roads and streets and bye lanes. The stalls are also arranged and the trustees of the Pagodas arrange for the temporary bazaars

With the spread of education and contact with the people of both the East and West, the Burmans have introduced remarkable changes in their daily life. The huts and bamboo planks which used to form the

A Burmese Passenger Cart

place of abode in times past, have been replaced by the houses of bricks with wooden partitions. The Burmese menfolk have begun to come forward and join hands in work with women carrying trade and business of large dimensions. As a result prosperity of both the land and the people becomes inevitable. Schools by missionary efforts are daily multiplying in numbers. They are now beginning to feel

as a nation and in fact efforts are now being made to make their public opinion echoed. The most commendable of the modern Burmian's activity is the foundation of the "Young Men's Buddhist Association" which directly aims at social, moral and national reforms. It bids fair to be a movement of which any son of the soil may legitimately be proud.

WORLD'S MARATHON CHAMPIONSHIP

SINCE writing in the February issue of this magazine, I have received many letters from various parts of India, of which one of special interest was from Mr. S. V. Dattar's friend, Mr. K. N. Dixit, M.A. Mr. Dixit's communication places me in a position to acquaint all my readers with the circumstances under which Mr. Dattar ran his memorable 27 miles, in an incredibly short space of time. As will be noticed from his photograph, Mr. Dattar is a brilliant athlete and our hope to see a champion amongst ourselves is very likely to be realised in him. He promises, as the reader will see from Mr. Dixit's letter, to run eleven miles per hour in his next attempt, and even if he runs ten miles an hour, he will do the necessary 25 miles in 2 hrs. 30 mts. and that will constitute a unique world's record. But we should not count the chickens before they are hatched; we must wait and see what Mr. Dattar can do in his next attempt. We have already accepted him to be the champion long-distance runner of the East and we do hope to see him as the world's greatest runner after his second attempt.

As a sort of introduction, it will not be absolutely out of place to say, that Mr. Dattar is self-trained, which proves clearly that Mr. Dattar is not only a man of wonderful stamina but a singularly brainy athlete. Intelligence is the mark of superiority in everything and it would be no mean encomium to Mr. Dattar to say that though he possesses little knowledge of books he has a wonderful brain as will be evident from his mode of training which

he had himself laid out and followed. What a wonder Mr. Dattar could have been, had he been in the hands of Springboke experts or of a great master of running! Mr. Dattar has undoubtedly reached a very high standard in athletics, though under very adverse circumstances, and we have been given to understand that he will be obliged to quit the track unless he is backed up sufficiently to keep in trim.

"Mr. Sadashiv Bishwanath Dattar was born at Sangli (150 miles south of Poona) in 1887 of poor, honest and respectable Brahmin parents," thus runs Mr. Dixit's letter to me. "His father started a modest primary vernacular school, which somehow enabled him to maintain himself, owing to the then very backward state of education, in the Sangli State. Sadashiv, the younger of his two sons, was clearly marked out from his boyhood, as a very active, naughty little fellow. While scarcely ten years of age young Sadashiv had the great misfortune of losing both his father and elder brother, who fell victims to the ravages of the inhuman scourge, which still devastates the Deccan, viz., the plague. With his primary education only half completed, Dattar had now to face the world, with scarcely anyone at his back, except his widowed mother. He soon found himself obliged to exchange his pen for a hammer, owing to the stress of circumstances. He has ever since maintained a little workshop of his own, where he shapes brass and copper vessels, a commodity for which

Sadasiv Viswanath Dattar.

Sangli is particularly famous in Maharashtra, though it barely suffices him to maintain himself and his family.

“When very young he began to cultivate the habit of physical exercise. At first he took a fancy to wrestling, but soon found running more to his taste. He began his career in running from his fifteenth year and soon found that he could run a course of two miles in 15 to 20 minutes. A year more and he hit upon a plan by which he could continue his practice uninterrupted. At a distance of $2\frac{1}{2}$ miles from Sangli, is an ancient temple of the God Siva, to which is imputed a special sanctity, owing to its being situated near the confluence of two rivers. Now Dattar took it into his head that if he could with religious scruple observe the practice of worshipping the holy Sangameshwar early at dawn, it would serve him a double purpose. Accordingly he has for the last ten years continued his practice of running to and from the temple, covering a distance of five miles within 25 minutes. As

it has been a part of his religion, he has never once failed in his daily practice; he would refuse to partake of the highest refreshment, before he saw his God Siva. The first time when he became conscious of his powers, was three years ago, when he ran to a place of pilgrimage in the neighbourhood, covering 14 miles within an hour and a quarter. First he would not believe himself, but the second time, being accompanied by a cyclist friend of his, he was for the first time fully alive to his own potentialities. Some of his friends having arranged for his run at the annual sports conducted by the Deccan Gymkhana here, he ran over $27\frac{1}{4}$ miles in 3 hrs. 8 mts. in March 1915, and over 27 miles in 2 hrs. 50 mts. $2\frac{1}{4}$ secs. in September 1915.

“Mr. Dattar's running dress, as will be clear from his photograph, is very simple, consisting of a shirt (which he generally damps before running), a short *dhoti*, and a cap. His feet are bare and in his hands he holds a cudgel, which is useful to him in scaring off reptiles as it is generally dark when he begins his work in the morning.

“The secret of Mr. Dattar's success is his temperance, regularity and perseverance. His diet and manners are extremely simple. As a Maharashtra Brahmin, he is a strict vegetarian and teetotaler. He takes his food three times a day, every time it consisting of nothing but millet bread, rice, curry and a vegetable. He is not accustomed to bread of wheat-flour, or fruits or to nourishing articles like almonds, pistachios, etc., generally used by Indian wrestlers. His quantity of milk never exceeds $\frac{1}{2}$ seer. He seldom takes more than his fixed quantity of food, and has consequently known no disease during the last 15 years. He is not habituated to take tea or coffee. He smokes occasionally, but it is not a habit with him. He is a strict bachelor.

“Strange to say, before Dattar exhibited his running feats, he was long known to Sangli as the best swimmer in the neighbourhood. During the rainy seasons, he is in the habit of swimming for hours together, when the river Krishna overflows her sides. He would remain in water, for a wonderfully long time and perform the most amazing tricks in swimming. He finds himself perfectly at home in water and would occasionally swim alone in the dead of the night, on high floods. It is a pleasure to see him floating down the

current at times, with both his hands tied, or swimming with only one hand. Both in swimming and running, he is always very cool, his breath is very constant, and his energy so very indefatigable after his huge exertions.

“His measurements are :—

Height	5-3 ³ / ₄ ”
Chest	33 ³ / ₄ ”
Do. (expanded)	35 ¹ / ₂ ”
Neck	13”
Biceps	10 ¹ / ₄ ”

Thigh	19 ¹ / ₂ ”
Calf	13”

It is obvious that Dattar labours under the natural disadvantage of height, as compared to European champions. He has received no training from an expert and had no partners or champions to help him in his efforts. He does not know the use of running pumps.”

This is the short sketch of Dattar's life I have obtained from Mr. Dixit. It would be absolutely clear to my readers under what a great disadvantage this great athlete labours. I understand from another letter of Mr. Dixit that Dattar will have to retire soon from the athletic world only for want of money. He cannot go on training and at the same time maintain his family, which is impossible. Had he been born in Europe or America, he would have been in different circumstances but things are very different down here. As a recognition of his great efforts he has only received a gold medal, but that cannot help him along a bit. Now it is incum-

bent upon us that we should back him up and help him to keep in condition with whatever monetary help we can readily offer him, in return of which Dattar has offered to run, either at Allahabad or Calcutta. I have failed to arrange for his run at Allahabad only for the lack of sporting spirit, which, I hope, the Calcutta public has enough in encouraging hockey and football. I have been requested to raise a fund for his next attempt at record breaking and if sufficient money is raised Dattar is ready to run at Calcutta this season. I appeal to the generosity of the public on his behalf through the medium of the *Modern Review*. All donations to this fund will be gratefully received by the Treasurer, The Allahabad and the Students' Sporting Clubs, Allahabad, or by Dattar's manager and friend, Mr. K. N. Dixit, M.A. 235 Budhwar, Poona City. If sufficient money is raised for backing Dattar, I shall come down to Calcutta with him and shall arrange matters. We shall put up a suitable prize, if Dattar succeeds in breaking the record and if he runs either at Allahabad or Calcutta. I do hope that the Secretary of the Calcutta Walking Association will please take up the matter in hand and help Dattar and myself in this noble cause. In the meantime I shall be very much gratified to correspond with him about the possibility of such a big run at Calcutta this season.

SACHINDRANATH MAZUMDAR.

Of The Allahabad Sporting Club,
Allahabad.

COMMENT AND CRITICISM

The Sikh and his new critics : our viewpoint.

BY MR. PURAN SINGH (DEHRA DUN).

MUCH has recently gone round the press on Sikhs and Sikhism. People have written books to prove that Sikhs were not Sikhs. Prof. Jadunath Sarkar and Sir Rabindranath Tagore are also amongst those who pity us. I cannot but smile at the utter ignorance of these great writers of the subject which they wish to clear up to the world. Prof. Jadunath Sarkar may be doing quite a good

making Aurangzeb his historical study, but he could commit no greater blunder than to speak of our Gurus in the same strain.

Prof. Jadunath Sarkar has written a small article on Sikhs in the April Number of the *Modern Review*. He has also quoted therein with some pride a previous article by Sir Rabindranath Tagore on the militarisation of the Sikh nation by Guru Gobind Singh, which they both mourn as a great fall from the lofty spirituality of Guru Nanak. As both have joined in their ignorance, I must say that our ideals of the life of spirit are quite different. We do not think that the longing of man for a sweet undisturbed calm or an

exquisite sweetness of human relations is the only high form of blossoming of life. The best blossoming of life may not be so much the blowing of the rose and the scattering of the cherry-petals by the roving winds in space filled with the little drum-sounds of the human octaves, as in the earth-splitting thunderbolts of heaven and the Almighty dissoliteness of all that seems. The best song is not sung by man in dreams of an Ideal Sweetheart, but one sung in chorus with the universal dance of death. All other songs are out of tune. The varied sweet strains that we modify out of our seven fundamental notes are best lost in the greater and mightier harmony of the bitter yells of a thundering angry sea. We believe in the sweet flower-like face of Jesus, and it is as good and sweet to pass some time with him, but in Mohammad we meet him in a still more serious and intenser mood. We believe all great men are but moods of the same One Great Man, the *Guru*. He whom we call *Guru Nanak* is the Ancient Man who was, is and shall be. People of limited vision cannot see that it was Mohammad's mood which drove out the money-changers from the temple of God. Mohammad's sword flashed in great and terrible awe of God. Mohammad could not express his spirit in any other way than to take up the sword. His kiss of sympathy on our cheeks is our sweet death. His mind is so highly intensified by his great love of his beautiful God that he begins killing people. We only need dare to understand his genius. Lord Gauranga had Krishna the War-God as his ideal. The Great Rama was a sword-wielder. We cannot look at things greater and higher than ourselves by standing where we are. Sir Tagore likes Guru Nanak because he does not know him beyond his being a sweet dreamy kind of an unitarian. I am sure if he knew him a little more, the present gamut of his mind will have nothing to do with him on the same ground and for the same reason which leads him to think that Guru Gobind Singh was a much lesser man than Guru Nanak.

Prof. Jadunath Sarkar in his article uses our private legendary diaries only as far as this helps him to condemn us. We never wrote history as the Moslem genius did. We wished to write mythology like the ancients descriptive of our heroes and we failed because most of us were not literary men. To treat our private writings so useful to us as the beginning of the great mythology we yet have to write through life and through love, as historical material, is absurd. He is not the first who has tried to ridicule us. The very first is Macauliffe, who has given such a miserable view of us to the English-speaking world. I would not care for the Sikh and his religion if I were to look through the glasses of Macauliffe. What has been Macauliffe's great work? He took from us a beautiful living figure whose beauty thrills us by every little curve of her face and every little mole on her temples, and he brought it back to us saying "how beautiful!" It was the same thing, but alas! the thing was dead. He has not changed anything of the original, only he has killed it and it is now a lifeless corpse as it is in his English. It is a pity that men like Sir Tagore and Jadunath Sarkar studied the Sikh from such dead materials. They have not taken up the trouble of scaling up to the required altitude to look at the Sikh. Prof. Sarkar in his fury of a great theist has failed to see that the persons of the Guru are sacred to us. It is a sin to injure the feelings of another, even if they be developing round a stone. Ah! Prof. Sarkar should know if he worships a personal God with any feelings, that our feelings alone name Him for us. There is no God but as we spell

Him through His Man and Nature. Some artists would prefer the landscape to the face of Man, others would prefer the face of man to the landscape, but pray, how do you spell or fashion your God? Feeling is all in all and how does he conclude that we cannot pour out our soul and all at the foot of our Men-Gurus with the jealousy of a theist which he has for his own-thought-God. We may be fools in differing from him, but he must know if he has any feelings that feelings are always foolish. It is against the goodness of Sir Tagore and Prof. Jadunath Sarkar to have come all the way from Bengal to injure us like this. Prof. Sarkar blames Guru Arjan Dev for organising the Church of the Disciples—the Sikhs. He says, like a "petty trader" the Guru started a Guru Treasury which he never used even to save his own life. Prof. Sarkar cannot bear a man of God having so much pomp and prosperity round him. But on account of his small stature, he misses the deep renunciation in this realisation of kingdom within and without. Does he not know that the Upanishads say that prosperity and learning wait with folded hands at the door of a man of God? *Brahmavilya* and *Upanishads* originally belonged to the kings, the *Kshatriyas* and not to the beggars, the Brahmins. The Guru did not wish to be a king, he could not help it. Men greater than Sir Rabindranath and Prof. Sarkar gathered round him and crowned him their king. This is the first time we hear from Sir Rabindranath and his disciple Prof. Sarkar that it is such a heinous spiritual sin to be a king of the hearts of men. The greatest sinner then is He who subordinates even such a will as Christ's, and Christ gladly cries out in joy,—"Father! Thy will be done." This person, the Great Guru Arjan Dev whom we crowned a king, met us often as our very slave. He used to ask his wife to cook and carry bread for us on the roadside waiting to welcome us coming from far and feed us as we came and he would fan us with his own hands and wash our feet. He would worship us first before we had the time to recognise him as the highest object of our worship. He was a poor man. He was no king in the sense in which Prof. Sarkar takes him to be. He clad himself in a black blanket, he ate little and sang to us his divine songs. He would not accept the union of his sons with the daughter of a proud rich man fond of this world and its pomp and he suffered death at the hands of this cruel and proud Hindu for that reason more than for the non-payment of a fine. As a matter of fact, Guru Arjan Dev rendered no assistance to Khusró. When Khusró was defeated in the battle of *Bharowal* all the adherents and supporters of Khusró were arrested in great number. It is evident from the records in *Jahangir Nama* that Jahangir was closely pursuing Khusró. Jahangir was at Sultanpore when Khusró reached Lahore. On the 15th (Ji-ul-haj) the battle of *Bharowal* was won and on the 30th Jahangir was at the garden of *Kamran* (Lahore). On the 3rd Moharram of 1015 Hijri, Khusró was produced before the Emperor. The latter remained in the garden of *Kamran* till the 9th. During these six days all adherents and supporters of Khusró, about 600 persons, were executed by *Sali*. But upto this time, nothing was said against Guru Arjan Dev Ji. If the Guru had done anything for Khusró, it must have been out by this time. The Emperor was encamped in the Guru Territory, Taran Taran, Goindwal and Amritsar for about two weeks after the battle of *Bharowal* and nothing transpired against the Guru. The spy system of Jahangir being on the other hand so efficient that he

heard about the prayers having been offered by Sheikh Nizam Benisi while he was at Thanesar's near Delhi. For this crime, the Sheikh was sentenced to transportation to Mecca. It is therefore very striking that a man as famous as Guru Arjan Dev should not have been detected, if he had openly helped Khuro or even prayed for him. The fact is that Chandu the Lahore Minister was waiting for an opportunity to wreak his vengeance on the Guru and it was he who got up a false charge against the Guru for his having appointed Khuro with a *tilak*. It is thus that he suffered more on account of the jealousy of Chandu, than for the political reasons. But even if it were the refusal to pay a heavy fine to the king out of the Guru's treasury, to save his life, it shows the man to everybody but not to Prof. Sarkar. Very strange, for him, he is a "Khatiri" with an eye on hoarding money and collecting pomp round his family.

The origin of "kingship" is there in the worship of man. If Gurus became our temporal kings, it is in the very nature of greatness and in the religion of "hero-worship" so deeply ingrained in human nature. For the mere reason of their having become temporal heads of the nation they created, it is grossly unjust on the part of Prof. Jadunath and Sir Rabindranath to call the Gurus as men who left their God and high ideals of Love and Life for mammon. Unless they thoroughly familiarise themselves with us and see with their own eyes the value of the worldly pomp that it had at the Guru's court, and unless they know with absolute certainty the inner life of the Gurus, they have no right to injure a neighbour nation taking advantage of their great position in the modern society.

The Sikh movement has been wholly misunderstood not only by Prof. Sarkar and Sir Rabindranath, but many of their type are thus. Guru Nanak contemplated of no metaphysical God. God is everywhere, it is difficult to find a man and still rarer to find a good man of God with his face towards the Divine. Once when asked by ascetics why he (Guru Nanak) roamed about so side of world, Guru Nanak replied he was roaming in search of a man of God. Guru Nanak's ideals of life are not what we think the highest ideals of a theist of to-day or what they call the ideals of the liberal religion of this scientific century. Nor are his ideals any akin to Kabir and Chaitanya or other Bhagats of medieval India that went before him in the light in which our critics see them. His ideals are the product of an highly original synthesis of the best in the Past with his own Realisation of the future religion of man. His synthesis is of such a grand nature as it can only be seen by a true idealistic agnostic like Goethe and not a theist so sectarian in his own notions of God and creation. In one word, Guru Nanak's religion is *continuous inspiration*, the keeping up of which in all the different spheres and conditions of life, *not one condition barred*, is the sole object of life on this earth. Guru Nanak's ideal is the ideal of the blossoming Bride. His renunciation is as of the Bride in the joys of love. That miserable pious self-sacrifice which is half-conscious of its high moral tone and is pathetic, so made by the pain of its renunciation and sadness for the love of the ideal, is discarded by Guru Nanak as trash. He insists on the ever-glowing inspiration of love, which if it is not there, nothing is there. In Guru Nanak's scheme of higher life of spirit, self-decoration is the highest renunciation. The Sikh is a Satee. On one side, his religion partakes of the sublime agnosticism of Buddha and on the

her of the beautiful Patience of the new Bride, and Guru Nanak's dance of joy like the Siva's dance, is on the kull of man. Guru Nanak found his disciples in Thugs and highway robbers. He was the greatest man-maker ever born. He cared little for society and religion with all the prescribed codes. His friends were farmers, carpenters and masons. Guru Nanak refuses to see God but through His Nature and Man. His best art was to see Him through Man. It is the poet of Nature where the best scene is the Man of God. If Guru Nanak does not give proof of his being a man-worshipper to the Brahmins of Bengal, let them come and read with us our *gathas* where he presents a coconut and five pice to Angad his disciple, goes three times around him and lays his head at the disciple's feet and says "Thou art Guru Nanak." Sir Rabindranath and Prof. Jadunath will not like this because it is not quite theistic to do so. But show me a prophet who made another like himself as Guru Nanak did. These people's praise of Guru Nanak too is a sort of an unwilling concession. They think too much of their own education. Leaving aside the prophet Nanak, the very first poet born in the Punjab after the death-hush of centuries that intervened between the song of Guru Nanak and the songs of Vedic rishis sung on the banks of the Punjab rivers, the very first thinker in this world (historically speaking) on comparative religion (the Akbar-Abu-ulfazal being the second and Raja Ram Mohan Roy the third) is given such scant praise by Prof. Jadunath as if the latter is even greater than Guru Nanak! Just imagine his saying "Even his (Guru Nanak's) hymns were mostly adapted from the sacred songs left behind by the monotheistic reformers of the past and had nothing distinctive." This is catholic theism run mad. Guru Nanak is the poet of Nature and Man. He is the master who knows every little string of the universal mind. I am sure Prof. Sarkar has not seen Guru Nanak's songs in original, otherwise he could not be so cruel as to call them adaptations from the "monotheistic reformers of the past." No. Guru Nanak looks straight into man and nature and his gaze is deep on the "Bridegroom." To him this world is the eternal marriage procession of the "Bridegroom." There is no second equal to him in this deep insight. Kalidas is but a reflection of Guru Nanak in his deep love of Nature. In no sense, can Kabir and Tukaram be said to come near him in his love of nature. He calls God the "*Kudrat Vasya*" the Presence in Nature. The morning reminds him of the first dawn of creation. The stars seem to him to be kindled by His breath. I could multiply examples of his classical poetry endlessly and I could challenge Prof. Sarkar to produce the clear cut crystalline thoughts expressed in single words such as "*Kudrat Vasya*," from any of his "monotheistic reformers of the past." Let him produce a line equivalent in beauty to any piece in Japji and Keertan Sohila. Show me a piece anywhere as sublime as *Arti* of Guru Nanak. Guru Nanak's descriptions of man shall for ever remain unsurpassable. The wonder and worship of his mind, the celestial music of his lines, the solace-giving power of his hymns shall mark his poetry out of the other literatures of the world as the greatest comforter of man in distress and the greatest awakener of man in oblivion of *maya*. If by "sacred songs" is meant somewhat monotonous unpoetic songs, then I must say that Prof. Sarkar knows not the type of Guru Nanak's poetry. It differs from Kabir and Tukaram as "eyes" differ

from "no eyes" in seeing Nature. Guru Nanak never touched his theme, but brought out the infinite music of his soul into the finite. Guru Nanak could not live even a day without the *Rabab* and the minstrel by his side to sing. He would call out "O Mardana! the Heaven's Voice cometh, strike thy *Rabab* and sing." Thus did he compose his songs under the stars of the sky in deep solitudes of his travels. Guru Arjan Dev calls Guru Nanak the *purusharasiik Buiragi*, the man of renunciation and the man of aesthetic taste. As a man, Guru Nanak could not live without music. Such a man is called by Prof. Sarkar only an adapter of the "sacred songs left behind by the monotheistic reformers of the past."

Guru Nanak's personal God was Guru Angad, and Guru Angad's God was Guru Nanak. This man-worship of Guru Nanak is God-worship. No true theism can exist in the heart of man without the true man-worship. These theists talk against man-worship only as long as they do not come across a true man of God. Man-worship is the basis of religion. And pray, what is poetry even, without the highest of man-worship suffused in it somewhere and somehow? Does not Browning dimly feel this highest spiritual truth which forms the corner-stone of the Sikh worship, what though even if the modern Sikh fails to grasp its true significance?—

"All tended to Mankind,

And man produced, all has its end thus far ;

But in completed man begins anew

A tendency to God."

Prof. Sarkar in his theistic fervour of a sort of moral ideal raised within himself by his clean clairvoyant conscience falls foul with everything Sikh for he thinks they worship man, for he reads that polygamy was allowed and quotes that Guru Har Rai when a boy was collectively married to the seven daughters of a Sikh and is very shy of such things in our history. He compares a Sikh with a *Tantia Bhil* and calls him a plunderer and a political rebel, thus exonerating his beloved Aurangzeb for his tyranny towards the Sikhs. This injustice to the Sikhs has not been done even by his worst enemies. For example, see the opinion expressed in Jangnama by Qazi Nur Muhammed. In 1178 Hijri, Ahmad Shah Abdali invited Nasir-uddin the Khan of Qillat for his help in conquering the Punjab. The Khan of Qillat requisitioned the services of Qazi Nur Muhammed of the family of the famous Nizami, the author of the Shah Nama, to write the descriptions of his invasion of the Punjab. This book written by the said Qazi is entitled Jang Nama, its manuscript is in Balochistan, a copy of which was secured by Bhai Karam Singh of Patiala in his historical excursions, who has kindly supplied me this information and the reference about Guru Arjan Dev made above. Nur Muhammed calls the Sikhs not 'Sikh' but "Sag" or "Dog". This appellation itself shows the bitter tone of his mind against the Sikhs. But even he is compelled to admire the character of the Sikhs. The following is the translation of his seven Persian couplets on the subject.

- (1) They fight not with the weak nor dishonour the fallen.
- (2) They do not touch the gold and jewellery belonging to the womenfolk. Nor do they anyway trouble the womankind.
- (3) Adultery is unknown in the sect of these "Dogs", nor do they steal nor rob.
- (4) They call all women whether young or old "Buriya" (the old woman).
- (5) There is no stealing with these dogs, nor ever a thief was born midst them.

- (6) Nor do they have any friends amongst those who rob, steal, or commit adultery. In all their deeds they are good.

- (7) If you know not their religion, I tell you such is their religion.

Nur Muhammed should speak thus and Prof. Sarkar calls them "plunderers" and "Tantia Bhils". I fail to understand the absolutely unjust indignation of Prof. Sarkar against the Sikhs of Guru Gobind Singh, who have done so much service to the motherland in the cause of patriotism and religion.

Moreover Prof. Sarkar thinks that mere boys were made Gurus. It is evidently under the strange hallucination that the power of the spirit comes only to the grown up. Unless a man can talk and compose songs, according to him, he cannot be a king of men. As an Indian, he forgets the intensity of soul of a *Dhruva* and a *Prahlad* who were mere boys. He forgets that the greater Krishna is the child Krishna and the boy-Krishna and not so much the philosopher and the king-Krishna. The wise men of the East bowed to the child Jesus with much greater devotion than his own eleven when he was quite a full-fledged teacher. To be the teacher of men is a very small affair indeed and perhaps a thankless one! The laws of human love and heart-life are quite different from the rules of historic research, and Guru Gobind Singh was a mere boy when he ruled over the hearts of his disciples as a sweet Autocrat Divine. But Prof. Sarkar has not that personal affection for the Guru which could see that the child Jesus and the boy Prahlad may possibly be born quite near him in the Punjab within the last two or three centuries.

Sir Tagore thinks of the Khalsa as a "cantonment of mere soldiers". But from what he writes on the subject, it is certain that he has never been inside the cantonment nor has he ever made a personal study of the character of those whom he calls "mere soldiers." If things have come to this pass, let me inform Sir Tagore that many a man of his temperament and genius have roamed and are roaming still in the Khalsa cantonment with a beggar's bowl in hand begging for the spark of life to be made alive in the Name of God. As Emerson says, one may dream for centuries that he is making spiritual progress, but after centuries he may find that he is exactly where he was. All progress, he remarks truly, is by the grace of some one's "Lyrical glances".—(Emerson on Inspiration.) Come! even now, let me show you the gleaming eyes under the old white Sikh brows that can cast on you that "lyrical glance" which one meets once in centuries. This is a "cantonment" but he is not misled by mere names and appearances! These are the tents where gods dwell. One has just left us. Sant Sawaya Singh of Amritsar was a "burning gem", a man of "Lyrical glances". A Sikh saint sometimes ago lived near Mastwana, Jind. His name was known to no one. They called him "*Ghup Ghun*", as he emitted like a bird the sound "Rab Tun"—(Thou art God). It was wilderness then, it is a temple of God now built by the songs of another Saint Atar Singh who is amidst us in these days, keeping thousands of Sikhs spellbound by his presence and his Kirtan.

Nor can Prof. Jadunath see that all biographies and histories of spiritual geniuses are lies. No true man can be seen by any but by himself and even this latter is very doubtful. Unless a Goethe chooses to make a great self-sacrifice to give secrets of his life out in his writings for the good of man, no historian can paint for us his private character. All history on such matters is guess work. If any one wishes

to see what sublime heights of purity and human character lay at the feet of the Gurus,—all the ten Gurus not one less than the other—he should read their writings in original and then alone he can have a glimpse into their soul, which we call “Guru Nanak.” Guru Nanak of Bengal is not our Guru Nanak.

First of all, the story he quotes of Guru Har Rai being married collectively to the seven daughters of one Sikh is on the face of it absurd. What should be the ages of the eldest and the youngest? In those days, the girls were married very early. Supposing the eldest to be of 14 years, the youngest could hardly be two years old, taking an interval of two years. No sane man could believe this. But let us take the hypothetical girls and legend as it is, so wonderfully rendered by our great Renan, Mr. Macauliffe. I would stand by it, but Prof. Sarkar as an historian of his reputed critical faculty has no right to take such things as historical materials. In fact, there is no authentic historical material with the Sikhs, which can be passed as pure historical records as a whole, except the Manuscripts of Guru Granth. There have been so many additions and alterations made in the original manuscripts of the *Sakhis*, by unscrupulous enemies of Sikhism and parties opposed to the Gurus that it is better to reject the most of them when discussing things so critically.

The immortal in us is our feelings of love. The cultivation of the highest feelings in our bosoms by gathering round a man of God is our daily and only worship. We know nothing more. A disciple's, a Sikh's getting up in the open Sikh congregation and offering with feelings unknown to us all his daughters to his God—Guru Har Rai—is a divine event in our diaries which poor old Macauliffe has missed and Prof. Jadunath has misread. For his information, I say, the feelings of the noble father rose out of the very soul of his daughters to be the Brides of Guru Nanak. The father could do no better service to his daughters. Our daughters, perhaps quite against the expectations of Prof. Sarkar, are not helpless children which a cruel father makes over to an indifferent husband according to his whim. Our daughters even as young children know the life-ideal of Guru Nanak and before it is sunrise, every morning, each one of them goes to the Guru and gets a greater sunrise in her soul through his grace. The expression of the uncontrollable feelings of love by that blessed disciple of Guru Nanak in this crude way, may strike Sir Rabindranath and Prof. Sarkar as savage but who dare deny that it is the highest religion?

What is it to “barter” a wife and a child if the Guru, God, wants a parrot? Ah! Prof. Sarkar knows not how is the kingdom of heaven won! If I can barter myself for the love of God and the Guru, I do not see any reason why I cannot barter all my own, even my wife and children provided I have made the latter through my strange love as near and dear to me as my own self. Ah! but mere “bartering” is quoted and the significance of the story is entirely omitted, perhaps not understood at all. The parrot-seller and his wife were struck dumb with the devotion of the Sikh. They honoured the Sikh lady and her child as if she were the Mother. The Guru hears of the event, he says to the Sikh “O Sikh! you have done a great cruelty to me.” The divine father runs to the side of his “bartered” daughter and his own grandchild. He brings them home and with them comes to the Guru the parrot-seller with all his family! The sublime devotion of one Sikh wins a whole family to the Sikh fold. This is the intensity

of love for God which alone appeals to us. What is Guru, if he is not God to us? The buying of a mere parrot in the name of God may sometime bring Heaven down while the whole shiploads of disciplined minds may miss it. “Bartering” loses all its sting, if the eyes are fixed on Him and in His Name goes everything and all, wife and children, friends and property. Our highest morality is this and not that which treats God at an arm's length and deals with Him like a gentleman or a lady of rank.

We read all our private diaries (containing similar sacred legends which we find scattered in all Eastern scriptures), which the critical world misuses as historical materials to ridicule us, only for kindling in us the life of feelings. Thinking in the modern sense is the death of the spirit, repeating as we do endlessly to each other what has been said so often. In those diaries we see nothing but one effulgent glory of God in whose iridescent brilliance we daily wish to die as moths. Our daughters even as young as of five summers wish nothing better than to be the Brides of Guru Nanak and Guru Gobind Singh. St. Therese was the Bride of Christ. She openly said so. In a similar way if we are Sikhs, our daughters still aspire after no higher God. To us, intense love is religion. Moth defines for us our conduct. We do not wish to know more, nor do we ever trust any codes of moral life. When Oodho bidden by Krishna—the King and the Philosopher—came to console the Gopikas of Brindaban and to advise them to worship God, they promptly replied:

“Oodho! Our hearts are not ten nor twenty!

We had only one, which has been stolen out of us by Krishna!

Go back and tell him, we cannot worship God!”

Prof. Sarkar quotes Bhai Guru Das and translates a portion of a hymn sung by him and tries to condemn us as stupid man-worshippers not knowing that the particular hymn of Bhai Guru Das puts the best of the highest possible religion of man in a brief compass. Let me inform Prof. Sarkar that the sentiments and thoughts of the highest poems in “Gitanjali” and “Gardener,” though not of the same richness of the word-perfume, just rise high enough to merge on the mystic heights into the sentiments of Bhai Guru Das. Bhai Guru Das is a great mystic poet. He sees in Sikhs what Tolstoy saw in peasants of Russia and in their blind faith in which Tolstoy found greater solace than in the whole of the learned solemn church. Bhai Guru Das sings like a poet interpreting the people and their life and not preaching a new religion to enslave man. When we differ so much, I need not stay to argue with Prof. Sarkar and Sir Rabindranath. I only say that the Olinic genius of Guru Nanak was even too much for Guru Nanak himself to allow him of a fair expression. It took ten different generations to complete its one repetition of the eternal alphabet of love. All boy-Gurus age Gurus, though Prof. Sarkar and Sir Rabindranath do not know this. Bhai Budha whom Prof. Sarkar brings as his witness is known more to us than to him. He might have enquired of the Guru the meaning of the sword, but then he put his hoary head forever at the feet of the Guru, because Bhai Budha saw Guru Nanak where Prof. Sarkar sees a military nobleman. Guru Har Kishan when giving up his physical vehicle at Delhi, the child-Harkishan said to the Sikhs, “Guru Nanak is at *Bakala*.” This child Guru saw what even men like Bhai Budha were not given to see. Guru Har Gobind was Guru Nanak of Bhai Budha. The life-long devotion of Bhai Budha to

Guru Har Gobind is much greater testimony of the lofty spirituality of Guru Har Gobind than a casual question or even a doubt of his own expressed to the Guru as reported. Bhai Budha was the disciple of Guru Nanak. He had seen all the five Gurus succeeding Guru Nanak. A saint of his independent nature must have revolted if what Prof. Jadunath says were true. But why should Prof. Sarkar study this side of the question? In this connection, I point out here that it is nothing but an unconscious misrepresentation for Prof. Jadunath to say that Guru Tegh Bahadur "succeeded in being recognised as Guru by most of the Sikhs." This suggests as if he ever sought it! Guru Tegh Bahadur lived in such sublime isolation that he was called "Mad Tegha." Nobody could notice him. It was the miracle of the Sikh devotion that found him out and forcibly crowned him a king.

The personality of Guru Gobind Singh is the Almighty Pearl of the sweet murmurs of Guru Nanak. Here are not the ordinary prophets of God whom everybody can praise and understand. They are those beings of inscrutable destiny to read whose character with any satisfaction of soul, the great ones wrote the Hindu and the Norse mythology for centuries and developed all those mystic arts for a partial expression of it, the arts the deciphering of whose lines and curves today constitutes the present-day genius of ours! I am sorry the poor dumb Sikh chroniclers have not yet had time enough to write sufficient mythology in the praise of their Gurus. What little these simple farmers of the Punjab wrote was so foolishly omitted by our friend Macauliffe. In his English translation we have mere bones before us. Perhaps it is impossible to translate Guru Granth, the songs of Guru Nanak into English, so imperfect is the language for the interpretation of the poetry of Guru Nanak. Some people have said in the newspapers that Guru Govind Singh was just another Shivaji of the Punjab. This is exactly the same insult which these luminaries of Bengal have offered us. We feel injured and we refuse to look at these puerile statements. What was Shivaji but an ordinary soldier of Guru Govind Singh minus his spirituality. Shivaji may be great politically, but it is fetish worship if we raise him in the eyes of the nation as a spiritual genius. All these learned scholars have combined to injure our feelings because Guru Govind Singh is much too high for them to understand. Sir Rabindranath as an unitarian has missed in his life the deep spiritual life that lies hidden in the man-worship of Guru Nanak.

If things were said about us, the present day Sikhs, we will welcome the brotherly wisdom from Bengal. But we strongly resent such unworthy things being said about the race of men that has gone before us. It is very painful to see that the keen-edged intellectual people of India sacrifice the best of human relations at the altar of this heartless goddess, the carping intellect. How can we love you as brothers, when you drive us mad in defence of the highest verity of our soul? Life is nothing to us, if you touch us thus, what to say of ideals and principles which are meant only to serve us only to live by. Man lives for one unknown thing hidden somewhere in him as the verity of his life. If you wish to spread peace, love and unity amongst mankind, do not touch man, even the poorest and the weakest, on that point in spite of your intellectual doubts, moral persuasions and high motives, for he would prefer death to this treatment. The wisdom of a neighbour lies in mutual respect of this sacred centre in man round which he revolves.

If a sympathetic student of the subject of genius

were to study the life of *Akaltes* that once were and alas! are no more, he will stand aghast at the sublime spirit so suddenly awakened by the touch of the genius of Guru Gobind Singh. What are the Ironsides of a Cromwell, even as compared with the *Akaltes*? Mere sea-spray against the rock! The devotional intensity of a *Billa-mangala*, the heroic recklessness of a Samurai of Japan, the richness of the spirit of a Diogenes, the mastery over self and senses as of a great Hindu Yogi, the mystic life of an Augustine, add all these and you come near a Sikh!

Feeling of religion was so intense and great that death was nothing to the Sikhs. Bhai Mani Singh was cut to pieces bit by bit and his face lost not the calm repose of "Naming Him". No historian can give one single instance of a Sikh of Guru Gobind Singh having ever given up his faith in temptation of a rich earthly life as a Moslem! The mothers would go with their innocent children to be willingly cut down while bathing in the sacred tank of the golden temple of Amritsar. Great mothers will make rejoicings and offer thanks to God at the death of their only sons in the holy cause of the Guru. To a real student, the story of an ordinary common Sikh would astonish him. He will see a saint concealed in silence,—a veritable king of men dressed in rags! Ah! He will see a teacher of men concealed from the vulgar ken by the ordinary practical life of a common man. Come, I will show you poets and saints in carpenters and masons. I will show you adepts in labourers. I will show you goddesses in ordinary poor Sikh girls. Come, I will show you the grand civilisation of the illiterate! Thank God that for the first time in the history of India, we Sikhs have forgotten that each one of us is a teacher and a God or that each one has finally to be one. We have learned well to obey, to dare and to die. There are living masters in the dumb singing Khalsa even of today, who would light fire in your soul and go away without even looking at you. They hide themselves from you.

Is this fanaticism? Well, Religion ceases to be an inspiration without it. Look at the fanaticism of Prof. Sarkar and Sir Rabindranath for what they consider spirituality and religion and they are incapable of seeing our view-point. It is in the nature of religion and every true religious man must boldly stand by some kind of religious madness.

Sir Rabindranath thinks, we as a nation are bankrupted because no teacher amongst us has been foolish enough to earn a reputation in Bengal. This opinion of his is the denial of very God! That spark which made Lord Chaitanya throw away a load of worthless books, the same pile which Prof. Sarkar is so laboriously making again, we nestle within ourselves. The Sikh saint still kindles the human heart. The Sikh of Guru Gobind Singh is a study and I believe the best study in the religious world. Okakura will appreciate him better than the outworn Hindu whose ideas of spiritual life have become so hopelessly confused and unhealthy. The life spiritual is known better to the agnostic artists of Japan than to the believing theists of India. Life in its infinitude and in its rough stormy vastness is too savage to be contained in the lines so deeply cut in our brains by the pen-knives of the modern education, the brains that have grown so sectarian that they have become incapable of thinking in any other possible direction. Killing is better than kissing in the eternal laws of Love. Let me have enough passion in my soul and I will get up and kill straight the very person I love most. Kissing and caressing, loving and longing,

are just expressions of that small portion of the octave of love on which poor man can lay his fingers to get out a sort of music for himself. But death and dissolution when brought in by Mohammed and Guru Govind Singh is our Salvation. It may seem war and bloodshed, but the wise know that it is only a great soul in serious Divine agitation. Guru Govind Singh is Guru Nanak in still greater glory and in a still mightier flash!

Guru Govind Singh understood Guru Nanak in a way in which nobody else in the world can ever understand! What he is to him, nobody else can be.

I was present when we asked Vivekananda about our Man, l'Homme, and I saw he became a poet of Guru Govinda Singh there and then. We asked Bhai Nand Lal from Afghanistan, the great scholar repated for his learning in his age, and we know he laid his head at the feet of Guru Govind Singh and then never raised it again from there. Bhai Nand Lal is the great mystic poet of the time of Guru Govind Singh. His poems descriptive of Guru Govind Singh are pearls of soul as of a Vedic Rishi to the dawn. This man knew him, ask him, what Guru Govind Singh is?

To go out of their way and to talk without much meaning and use of such sacred things in the way and in the language in which Prof. Sarkar and Sir Rabindranath have chosen to speak of them, clearly proves to us the utter bankruptcy of soul that the modern liberal religious thought causes even in such high quarters. It is a sheer disappointment to us to see the failure of Prof. Sarkar and Sir Rabindranath Tagore to appreciate the high spirituality of the Sikh and his Gurus. We attach no weight to their opinions, as to us Sir Rabindranath and Prof. Sarkar seem to be talking like two unitarians from America or England whose ideal is but a shapeless haze, absolutely unfamiliar with the intensity of our oriental soul.

Verily, we say, we are man-worshippers, we are idol-worshippers, but show us the God or Gods you worship.

Resist not evil or अहिंसा।

Jesus Christ said "Resist not evil." Tolstoy has shown that Jesus meant it *literally*. Jesus condemned anger *unconditionally*. Tolstoy pointed out that the phrase "without a cause" was interpolated by worldly wise improvers of Christ's teaching in the sentence "He who is angry with his brother [without a cause] is in danger of the judgment." You are never to be angry, not even under grave provocation. It is worthy of note that the new version of the English Bible does not contain the words "without a cause," though the authorised version has them; and this is due to Tolstoy's labours in biblical criticism.

Now, can it be said that Jesus was *right* when he preached this doctrine? Would Belgium have been right to turn her right cheek to the German, when he slapped her on the left cheek? Tolstoy would have said 'yes.' The well-known Cambridge writer Bertrand Russel has said 'yes'.

What would Hindus say? What would Krishna have said? Krishna said in the *Gita* most unequivocally that War is a sacred duty in defence of Right. The other Hindu Sastras say the same thing.

Hinduism also teaches the doctrine of 'resist not evil or ineffable love' अक्रियभिवारिणो i. e. you are to love your enemies even: your love or *bhakti* must not have any exception or *vyabhichara*. But this is meant for *Sannyasis*: for those who have left the world and who have given *abhaya* to all creatures. [In modern language, men of religion, priests and monks and nuns are not to fight even for a right cause.] All others, whether Brahmins, Kshatriyas, Vaishyas, Sudras, ought to resist evil.

I have a suspicion that Christ's teaching has been borrowed from the teachings of the fourth *asrama* in India, and that his followers or rather those who profess to follow him, have wrongly given a universal character to Christ's teachings which could only be meant for those who left their families and adopted the fourth *asrama*. Even modern *Sannyasis* [and these are undoubtedly of Jesus's type] preach as if they want every man to become a *Sannyasin*. "Well, if every man becomes a *Sannyasin*, the world would soon cease to contain any man." "Yes. But notwithstanding our preaching, the vast majority will remain in the world and have remained in the world. Hence our preaching is no evil. Similarly Christ Jesus might say "notwithstanding my teaching—resist not evil—the majority will resist evil. I meant it as an ideal to be literally followed only by monks. I did not mean it for the people of Belgium at all."

Universal *ahimsa* is also an ideal. It is pragmatically justified by its results and might be taught as if it were wholly true.

Ahimsa and *paropakara* are the two sides of the same ideal of universal love सर्वेषु भूतेषु अक्रियभिवारिणो॥ The present Hindu society unduly emphasises the former. To say that अहिंसा has a positive side is to force unyielding facts into too narrow theories. *Ahimsa* is negative; *upakara* is positive. नोपकारात् परं पुण्य must be joined to मा हिंसा सर्वा भूतानि to get a complete idea of love or *bhakti*.

BANAMALI CHAKRABARTTI.

HOPE'S AWAKENING

BY NAWAF SIR SY'UD WASIF ALI MEERZA BAHADUR OF MURSHIDABAD.

The day is done and night creeps on,
See the birds are homeward flying,
The leaves on which the sun has shone
Sigh because the day is dying.

How peaceful seems the world at rest
Enwapt in darkness all around ;
Shadows creep down the hill's high crest
With silent steps to tread the ground.

In darkness dwell conceal'd from sight
All works of Nature's tender care ;
Beyond recall seems Heaven's light ;
Cover'd in gloom the world doth wear

A cheerless countenance. But lo !
Night's gloom heralds a coming morn—
A less'n of patience in sorrow,
Of suff'ring is heav'nly peace born.

Soul-refreshing thoughts soon prevail
When fortune smiles on dark despair ;
Where sorrow reign'd sweet joy doth dwell.
After weary night a day-break fair.

Perch'd on the tree the Bulbul sings
To the silvery lake, alone :
Borne by the breeze its echo brings
Cheer to sad hearts that in silence mourn.

MISLEADING EDUCATIONAL STATISTICS

IN the 100th number of this Review, i.e., for April 1915, it was clearly shown how the figure of 15 per cent. assumed by the Government Education Department as representing the proportion of school-going-age population to the total population of India was misleading and an under-estimate. "School" in official language includes schools of all sorts, primary, secondary, technical and colleges and universities. From figures of population actually at school in the several states of U. S. of America and in the various countries of Europe and Australia it was conclusively proved that the figure varied between 23 and 24 and much shorter than that in American and European countries which is between 15 and 27 per cent. and that therefore the probable figure for such percentage in India ought to be rather 30 than 15. In India the average life is only between 40 and 50 and therefore the proportion of school-going-age population, i.e., population of say between 6 and 20 years of age to the total population, must be much greater in this country than in coun-

tries where average life is much longer. However, leaving this consideration of the effect of average life on educational statistics aside and going only from the figures of population actually at school in those advanced countries it is quite evident that the 15 per cent. figure assumed is obviously an under-estimate and in fairness and truth should be corrected by the Government as early as possible to the more probable figure of 30. If the figure of 15 per cent is assumed to represent only *primary-school-age* population, i.e., between the years of 6 and 12 it is very near the truth as shown from 1911 census figures by Hon. Mr. H. Sharp in "Progress of Education in India, 1907-1912" Vol. I, p. 15. He says :

"The school-going population has been calculated in India as 15 per cent. of the population. Doubts have recently been cast upon this conventional figure.

.....
On the one hand, in a country which is tropical and sub-tropical the proportion of the population contained in the earlier age-periods is larger than in cold climates.....

"The primary course (and this is all that need be considered) ordinarily occupies from 5 to 6 years ; and the average age of school-life is from the comple-

tion of the tenth to the completion of the eleventh or twelfth year. These ages include (if we reckon to the end of the eleventh year) 13.7 per cent of the population, (if we reckon to the end of the twelfth year) just below 16 per cent. The old figure of 15 per cent. may therefore be taken as fairly correct."

How he jumps at once from 15 per cent as representing *primary*-school-age population to representing *all-school*-age population is a feat of jugglery which cannot be understood by the reasoning power of an ordinary human being.

In this note an attempt is made to prove the incorrectness of the figure of 15 per cent from the figures of male population actually at school in several Municipal areas in the Madras Presidency on 1st April 1915, taken from the official Report on Public Instruction. Had education of girls advanced in this country as much as that of boys, which it unfortunately has not, figures for education of female population would have been equally high, and therefore of total population. But the conclusion with regard to the percentage derived from figures of education of male population of any country stands good without the least modification for education of total population of that country.

Madras Presidency has more of its population urban than Bengal but less than Bombay. In Bombay one person in every 5 living in that presidency lives in towns, in Madras 1 in 8½ and in Bengal 1 in 15½. Thus nearly 12 per cent of the total population of Madras Presidency lives in towns or Municipal areas. There are 64 *tash* areas in the presidency including the city of Madras. Now out of these 64 areas as many as 47 or nearly three quarters have their school-going population above 15 per cent of their respective total population. Here school is taken to mean, as in official language, all schools and colleges. Is this not a startling fact that in 47 Municipal towns out of 64 in the Madras Presidency more than 15 per cent of the total population of the towns, i.e., more than the maximum ever attainable in the opinion of the Education Department, is already at school on the voluntary system? If compulsion by law, even for the primary stage of education, be resorted to in these areas, the percentage will be still higher and the supposed maximum of 15 per cent. will be left far far behind the actual percentage which the school population in those and other towns may then attain. Is this not enough to show

without a shred of doubt that the maximum of 15 per cent assumed by the department is a gross underestimate? I give below the table of the more populous of these fortunate 46 towns, and where more than the maximum number of boys are already receiving education and where there is no scope for more boys being brought to school in the opinion of the Department.

No.	Name of the town.	Total population.	Total male population.	Male population actually at school.	Per cent- age of col. 5 to 4.
1	Trichinopoly	1,23,512	61,560	11,427	18.5
2	Cahoot	78,417	40,680	6,821	16.8
3	Kumbakonam	64,647	31,327	5,593	17.4
4	Tanjore	60,341	28,777	5,437	18.9
5	Salem	59,153	29,232	5,518	18.9
6	Cocanada	54,110	26,629	4,642	17.4
7	Vellore	49,746	23,831	4,169	17.5
8	Rajahmundry	48,417	23,761	4,424	18.6
9	Mangalore	48,412	25,129	5,547	22.1
10	Combatores	47,007	23,399	5,428	23.2
11	Pallancottah	44,909	21,231	3,695	17.4
12	Tinnevely	44,805	21,246	4,200	19.8
13	Palghat	44,319	21,776	3,669	16.7
14	Vizagapatam	43,413	21,465	4,289	20.0
15	Masulipatam	42,123	20,536	4,311	21.0
16	Guntur	40,529	20,826	3,846	18.5
17	Ellore	37,819	18,302	2,975	16.3
18	Vizianagram	37,550	17,897	3,932	22.0
19	Nellore	33,246	16,180	2,865	17.7
20	Bezwada	32,867	17,026	2,654	15.0
21	Berhampur	31,456	15,331	2,577	16.8
22	Tellicherry	29,258	14,275	2,948	21.4
23	Cannanore	28,957	14,241	2,294	16.1
24	Mayavaram	27,121	13,264	2,869	21.6
25	Kurnool	26,040	12,766	2,757	21.6
26	Dindigul	25,052	12,720	2,290	18.0

Some one will argue that there is a source of error in the calculations given above and it is that boys migrating from villages to the towns mentioned above and staying there temporarily for study in high schools and colleges are included and their number ought to be eliminated to arrive at the correct percentage in the last column. This is no doubt correct. If figures of such boys were available, they should no doubt be deducted from figures in column 5 and the percentage in column 6 would be reduced to that extent. But this reduction would be very slight, not more than 1 to 2 per cent. Out of the 15 to 23 per cent male population shown in column 6, 9 to 14 per cent are made up by students of elementary and private schools only, the remaining 6 to 9 per cent being made up of boys studying in Secondary schools and colleges. At a rough estimate we can say that not more than one quarter of the total number of boys studying in all secondary schools and colleges came from

outside the Municipal areas, and hence a deduction of $\frac{1}{4}$ of 6 to 9 per cent, or say 2 per cent, should be made in order to eliminate any possible error due to temporary residence of village boys as pupils in the towns. Even after making this fairly liberal allowance of 2 per cent the 46 towns have 13 to 21 per cent, and in cases of some smaller towns more than 21 per cent, of their male population actually at school, a state of things approximating the ideal, or having gone beyond the ideal aimed at by the education department. Surely there is something wrong with this ideal, as it is too much to believe, though told to do so by the Education Department of the Government of India, that several large towns in the Madras Presidency, with their industrial and illiterate masses, have by the purely voluntary system gone much beyond the haven of education, and that there is no scope in these happy cities for a Compulsory Education Act. It is now high time for the department to change its maximum of school-age population from 15 per cent to 30 per cent of total population.

Madras and Madura are the largest cities in Madras Presidency, the former having a population of 5,18,660 and the latter 1,34,130. It is a well known fact

that in very large towns, there is always a much larger proportion of labouring and therefore illiterate population than in less populous towns of, say, 25,000 to one lakh. The city of Bombay with nearly a million souls has smaller percentage of its population at school than Ahmedabad. Karachi, Poona and Surat which have a population of one lakh to two and a quarter lakhs, and still smaller than towns having a population of less than a lakh of souls. Notwithstanding this fact Madras and Madura have 14.0 and 14.5 per cent of their population respectively at school, which is practically saying that in spite of their unfavourable circumstances with regard to mass education they have nearly reached the goal of education set before us by our rulers. We may hope that at the time of the publication of the next quinquennial report on education in India, i.e., for the period 1912-17 this gross underestimate of the maximum population that can be at school will be rectified and that educational statistics will be shown in their true dimensions and not double of what they actually are.

A. V. THAKKAR.

India Society.

THE ADMINISTRATION OF JUSTICE IN ANCIENT INDIA

BY DR. PRAMATHANATH BANERJI, M.A. (CAL.) D.SC. (LONDON).

IN early Vedic times justice was administered by the tribe and clan assemblies, and the judicial procedure was very simple.¹ But with the extension of the

functions of the State and the growth of the royal powers, the King came gradually to be regarded as the fountain of justice,² and a more or less elaborate system of judicial administration came into existence.

According to Brihaspati, "judicial

punishment (Danda) confirm this supposition. Vedic Index. I. Pp. 391-392.

He adds that there is very little recorded as to civil law or procedure in early Vedic literature.

2 "The King is the fountain-head of justice." Narada, (Jolly), Legal Procedure, III. 7. But Brihaspati says: "A Brahmana is the root of the tree of justice; the sovereign prince is its stem and branches; the ministers are its leaves and blossoms; and just government is its fruit." I. 34.

1 Prof. Macdonell says: "(In the early Vedic Age) there is no trace of an organised criminal justice vested either in the King or in the people. There still seems to have prevailed the system of wergeld (Vaira), which indicates that criminal justice seems to have remained in the hands of those who were wronged. In the Sutras, on the other hand, the King's peace is recognised as infringed, a penalty being paid to him, or according to the Brahminical text-books, to the Brahmins. It may, therefore, reasonably be conjectured that the royal power of jurisdiction steadily increased; the references in the Satapatha-Brahmana to the King as wielding

assemblies are of four sorts: stationary, not stationary, furnished with the King's signet ring, and directed (by the King). The judges are of as many sorts. A stationary court meets in a town or village; one not stationary is called movable; one furnished with (the King's) signet ring is superintended by the Chief Judge; one directed is held in the King's presence."¹

Narada says: "Family meetings (*kula*), corporations (*sreni*), village assemblies (*gana*), one appointed (by the King), and the King (himself) are invested with the power to decide lawsuits; and of these, each succeeding is superior to the one preceding it in order."²

At the head of the judicial system stood the King's Court. This Court was held at the capital, and was presided over, sometimes by the King himself, but more often by a learned Brahmana appointed for the purpose, who was known as the *Adhyaksha* or *Sabhapati*. The *Adhyaksha*, perhaps originally selected for each particular occasion, in course of time became a permanent Officer-of-State, and held the position of the Chief Justice (*Pradvivaka*) of the realm. The King, together with the *Pradvivaka* and three or four other judges (*dharmikah*), formed the highest Court of Justice.³ It was, however, the Chief Justice who in reality presided over the King's Court, even when the King was present. Narada says: "Attending to the dictates of the law book and adhering to the opinion of his Chief Justice, let him (i.e. the King) try causes in due order, exhibiting great care."⁴ *Brihaspati* describes the respective duties of the different members of the King's Court in these words: "The Chief Justice decides causes: the King inflicts punishments: the judges investigate the merits of the case."⁵ The

number of judges varied. According to Manu, three judges, besides the Chief Justice, were enough to form a court, but Chanakya held that the judicial assembly should consist of six persons,—three Officers-of-State, and three other learned persons.¹ According to the *Sukraniti*, the number of judges was to be uneven,—seven, five, or three.

The jury system, as it now prevails in the European countries, is somewhat different from what prevailed in Ancient India. The three or five members of the judicial assembly acted as jurors as well as judges, but the final decision rested with the Chief Judge. There is, however, one point on which we still require more light. It seems that, besides the members of the assembly, other persons present in court were permitted, on certain occasions, to offer their opinions. Narada says: "Whether authorised or unauthorised, one acquainted with the law shall give his opinion. He passes a divine sentence who acts up to the dictates of law."² The *Sukraniti* quotes this passage with approval, and adds: "Duly qualified merchants should be made hearers."³ The *Sukraniti* also quotes another passage from the *Smritis*, namely, "Either the court-house should not be entered, or the right word should be said. A man who does not speak, or speaks unjustly, incurs sin." The point is not clear, and we wonder how the custom, if it existed at all, worked in practice.

The Chief Justice and the puisne judges were chosen in view of their eminent character and deep learning.⁴ They were,

the judicial assembly." Manu, VIII. 10. The *Sukraniti* also says that the chief judge should sit with the members of the judicial assembly (*sabhya sabha*) to decide cases. II. 96.

1 Arthashastra, Bk. III. ch. 1.

2 Narada, Legal Procedure, III. 2.

3 Sukraniti, IV. 5, 27.

4 "The King should appoint as judges persons who are well versed in the Vedas and the other branches of learning, who are acquainted with the Sacred Law, and who are truthful and impartial towards friends and foes." Yajnavalkya, II. 2-3. Cf. *Brihaspati*, I. 29-30, and *Sukraniti*, IV. 5, 14. Narada says: "He is called a (*Pradvivaka*) chief judge who—fully acquainted with the eighteen titles (of law) and with the eight thousand subdivisions thereof, skilled in logic and other branches of science, and thoroughly versed in revealed and traditional lore—investigates the law relative to the case in hand by putting questions (*prat*) and passing a decision (*vivechayati*) according to what was heard or understood by him." Quotations from Narada, I. 1-2. Books of the East, Vol. XXXIII.

1. *Brihaspati*, I. 2-3.

2. Legal Procedure (Jolly), 7.

3. Manu says: "A King desirous of investigating law cases must enter his Court of Justice, preserving a dignified demeanour, together with Brahmanas and experienced councillors. There, either seated or standing, raising his right arm, without ostentation of his dress or ornaments, let him examine the business of suitors." VIII. 12.

Yajnavalkya says: "The King, putting aside wrath and covetousness, should decide cases with the assistance of learned Brahmanas and in accordance with law." II. 1. According to the *Sukraniti*, the King was never to try cases alone and by himself.

4. Narada (Jolly), Legal Procedure, 35.

5. *Brihaspati*, I. 6. "He (the *Adhyaksha*) should decide cases with the assistance of three members (of

as a rule, Brahmanas, but sometimes a few of them were selected from the other castes.

The King's Court, it seems, had two sorts of jurisdiction, namely, original and appellate. As an original court it tried all cases which arose within the boundaries of the capital. On its appellate side it was the highest Court of Appeal for all cases which were triable in the first instance by the inferior courts.¹ The King's Court also exercised a sort of general supervision over the administration of justice throughout the country.

Next in importance to the King's Court were the principal courts held in the important centres² and in the larger towns forming the headquarters of districts or sub-districts.³ The constitution of these courts was very similar to that of the King's Court. Royal officers, assisted by persons learned in the law, administered justice in these courts. They were presided over by adhyakshas appointed by the Central Government. They had original jurisdiction in respect of all cases arising within the boundaries of the towns in which they sat, and also of the more important civil and criminal cases occurring in the neighbouring villages. And it seems that they had a sort of appellate jurisdiction over the decisions of the lower courts within the districts or sub-districts of which the towns formed the headquarters.

As a rule, the same courts tried both civil and criminal cases. The Smṛiti works do not draw any distinction between civil and criminal courts. But Chanakya mentions, besides the ordinary law courts (dharmasthiya), a class of "courts for the removal of the thorns of the state" (Kantaka-sodhana). These latter were what may be called administrative courts. They were presided over by three Officers-of-State,⁴ and dealt with offences which affected not so much the rights of individuals as the interests of the community, and interfered with the proper government of the realm.⁵

Besides these courts, each village had its local court, which was composed of the headman and the elders of the village.¹ Such courts decided minor criminal cases, such as petty thefts, as well as civil suits of a trifling nature, like disputes relating to the boundaries of lands situated within the village.² Their powers it seems, were limited to the transfer of the possession of property and the inflicting of small fines. Decisions in these courts were given in accordance with the opinion of the majority of honest persons composing the courts.³ The idea of a system of local courts for the disposal of cases seems to have been firmly rooted in the minds of the people. The Sukraniti says: "They are the (best) judges of the merits of a case who live in the place where the accused person resides, and where the subject-matter of the dispute has arisen."⁴ Brihaspati goes so far as to recommend that "for persons roaming in the forest a court should be held in the forest, for warriors in the camp, and for merchants in the caravan."⁵ And it seems that this recommendation was, at least on many occasions, carried into effect for the convenience of suitors. From a Ceylon inscription we learn that itinerant justices from the capital used to visit different parts of the island for the disposal of cases and for the purpose of supervising the system of administration of justice.⁶ It

1 'Grama-vriddhah,' Arthashastra, Bk. III. ch. 9.

2 A flood of light is thrown on the system of administration of justice in Ceylon by the Veva'akatiya Slab-inscription of Mahinda IV. (1026-1042 A.D.). From this inscription we learn that within the Dasagama justice was administered by means of a Communal Court composed of headmen and responsible householders subject to the authority of the King in Council, and that this Court had the power to try all cases and to inflict even the extreme punishment of death. It runs thus: "... They (the headmen and the householders) shall sit in session and enquire of the inhabitants of the Dasagam (in regard to these crimes). The proceedings of the enquiry having been so recorded that the same may be produced (hereafter), they shall have the murderer punished with death. Out of the property taken by the thieves by violence, they shall have such things as have been identified restored to their respective owners, and have (the thieves) hanged. . . ." Epigraphia Zeylonica, Vol. I. No. 21.

4 These officials were to be either ministers (amatyah) or directors (pradestarah). Arthashastra, Bk. IV, ch. 1.

5 Arthashastra, Bk. IV., deals with cases which were triable by these administrative courts.

is very probable that a similar system existed in India also.

The work of the regular courts was greatly lightened by arbitrators. All cases, except those concerning violent crimes, could be decided by arbitration by guilds of artisans, assemblies of co-habitants, meetings of religious sects, and by other bodies duly authorised by the King.¹ Narada is a great believer in the system of arbitration, and he says: "(In disputes) among merchants, artisans or the like persons, and in (disputes concerning) persons subsisting by agriculture or as dyers, it is impossible for outsiders to pass a sentence; and the passing of the sentence must, therefore, be entrusted to persons acquainted with such matters (in a cause of this sort)." This system had the great merit of giving substantial justice to the disputants and, at the same time, preventing ruinous litigation.

The relations subsisting between the different kinds of courts are thus described by Brihaspati: "When a cause has not been (duly) investigated by (meetings of) kindred, it should be decided after due deliberation by companies (of artisans); when it has not been duly examined by companies (of artisans), it should be decided by assemblies (of co-habitants); and when it has not been (sufficiently) made out by such assemblies (it should be) tried by appointed (judges)."² And again, "Judges are superior in authority to (meetings of) kindred and the rest: the chief judge is placed above them; and the King is superior to all, because he passes just sentences" (Yajñavalkya).³ Narada⁴ also describes these relations in terms almost identical with those used by Brihaspati. A gatha quoted by Asahaya in his commentary of Narada runs thus: "A case tried in the village (assembly) goes (on appeal) to the city (court); and one tried in the city (court) goes (on appeal) to the King

(i.e. the King's Court); but there is no appeal from the decision of the King, whether the decision be right or wrong."¹ These and other similar passages leave no doubt in our minds that there was a regular mode of appeal from the decisions of the inferior courts to the superior courts. How far this right of appeal was recognised in practice, and to what extent the people actually availed themselves of the right are questions which our present knowledge of the history of Ancient India does not enable us to answer with any degree of satisfaction.

So much about the Courts of Justice. We now pass on to a consideration of judicial procedure as it prevailed in Ancient India. Justice was administered in accordance with legal rules which fell under one or other of the following four heads: (a) Sacred Law (Dharma), (b) Secular Law (Vyavahara), (c) Custom (Charitra), and (d) Royal Commands (Rajasasana).² "Sacred Law," says Chanakya, "is the embodiment of truth; Secular Law depends upon evidence; Custom is decided by the opinion of people; and Royal Edicts constitute administrative law."³ Some of the Smṛiti works adopt slightly different orders of classification, and they are often unwilling to admit the validity of Royal Edicts in the administration of justice. Opinion is also divided as to the relative importance of the different sets of legal rules. Chanakya and Narada agree in holding that "each following one is superior to the one previously named" in the above classification; but the former adds, "When there is disagreement between Sacred Law and Secular Law, or between Sacred Law and Custom, the matter should be decided according to Sacred Law. When, however, there is disagreement

1 Jolly, Narada, footnote to I. 11:

"Grame dristah pure yati pura dristastu rajani
Rajaa dristah kudristo va nasti paunarbhavo
vidhih."

¹ Brihaspati, I. 28. Vide also Sukraniti, Ch. IV. sec. 5.

² I. 30. Brihaspati adds: "(Meetings of) kindred, companies (of artisans), assemblies (of co-habitants), and chief judges are declared to be resorts for the passing of a sentence, to whom he whose cause has been previously tried may appeal in succession." I. 29.

³ "Kulaṇi srenayashaiva ganaschadhikrito
nripah."
Pratistha vyavaharanam purvebhyastuttarottaram."
Narada (Jolly's edn.), I. 7.

⁴ Yajñavalkya, II. 30

² Arthashastra, Bk. III. ch. 1. The Smṛiti works adopt slightly different orders of classification.

³ Arthashastra, Bk. III. ch. 1. A similar passage occurs in Narada (Legal Procedure, 10-11); but instead of 'caritram sangrahe pumsam,' we find there the words 'caritram pustakarane.' Prof. Jolly's translation of this passage does not appear to us to be correct.

'Vyavahara' is defined in the Sukraniti as that "which, by discriminating between good and evil, enables the people to remain on the path of virtue, and promotes their welfare." IV. 5.1.

between Sacred Law and morality, morality shall prevail, for it is likely that the original text (governing such a case) has been lost."¹ According to Narada, "When it is impossible to act up to the precepts of Sacred Law, it becomes necessary to adopt a method founded on reasoning, because Custom decides everything and overrules the Sacred Law. Divine Law has a subtle nature, and is occult and difficult to understand. Therefore (the King or the judges) must try causes according 'to the visible path.'"² Thus, in practice, customs were the most of the four divisions of law, and Manu³ and almost all the other lawyers lay it down as the essential principle in the administration of justice that disputes should be decided according to the customs of countries and districts (janapada), of castes (jati), of guilds (sreni), and of families (kula).

The regular courts met once or twice every day, usually in the mornings and evenings. The Court-house was looked upon as a sacred place, and it was open to all. Trials were always held in public. The Sukraniti says: "Neither the King nor the members of the judicial assembly should ever try cases in private."⁴ Cases were taken up for disposal either in the order of their respective applications, or of their urgency, or of the nature of the injury suffered, or of the relative importance of the castes⁵ of suitors. The royal officers were strictly forbidden to take any part either in the commencement or in the subsequent conduct of a suit. Manu is very emphatic on this point. "Neither the King," says he, "nor any servant of his shall cause a lawsuit to be begun, or hush up one that has been brought (before the court) by (some) other (person)."⁶ It is not very clear whether this rule was confined only to civil suits, or applied to criminal cases as well. But it is probable that, in the graver criminal offences, the State took upon itself the duty of conducting the prosecution.⁷

1 *Ārthasastra*, Bk. III. ch. 1. Vajhavalikya, comparing *Dharmasastra* and *Ārthasastra*, remarks that the former is the more authoritative of the two.

2 Narada (Jolly), *Legal Procedure*, 41.

3 Manu, VIII. 41.

4 Sukraniti, IV. 4, 6.

5 Sukraniti, IV. 5, 161.

6 Manu, VIII. 13. Cf. Narada (Jolly), *Judicial Procedure*, 3.

7 In the trial scene in the *Sudra* (Mitrachakataka,

Lawsuits, according to Narada, have three efficient causes, for they proceed from one or other of three motives, namely, carnal desire, wrath, and greed.¹ "When mortals," says Narada, "were bent on doing their duty, and were habitually veracious, there existed neither lawsuits, nor hatred, nor selfishness. The practice of duty having died out among mankind, lawsuits have been introduced."² The topics which gave rise to lawsuits were grouped by the law-givers under eighteen titles, namely, (1) recovery of debts, (2) deposit and pledge, (3) sale without ownership, (4) concerns among partners, (5) resumption of gifts, (6) non-payment of wages, (7) non-performance of agreements, (8) rescission of sale and purchase, (9) disputes between owners of cattle and herdsmen, (10) disputes regarding boundaries, (11) assault, (12) defamation, (13) theft, (14) robbery and violence, (15) adultery, (16) duties of man and wife, (17) inheritance and partition, and (18) gambling and betting.³ It is evident that the list includes both civil and criminal cases. Although it was not found necessary to draw a line of separation between the two classes, the distinction, it appears, was fully understood. This becomes clear from the following passage which occurs in Brihaspati Smṛiti: "Law-suits are of two kinds, according as they originate in (demands regarding) wealth or in injuries. Law-suits originating in wealth are (divided again) into fourteen sorts, those originating in injuries into four sorts."⁴ Most of these titles had sub-divisions, which, taken together, amounted to one hundred and thirty-two.⁵

however, we find that in a murder case the court commences its proceedings on the application of a private person (arthi). It is difficult to say whether this was or was not the usual practice.

1 Narada (Jolly), I. 26.

2 Narada (Jolly's edn), I. 1-2. This is an illustration of the fact that men in all ages have looked back upon the remote past as the Golden Age of the World.

3 Manu, VIII. 4-7. The titles given in some of the other law books are slightly different.

4 Brihaspati, II. 5.

5 Narada gives the following list: "'Recovery of debt' has twenty-five divisions; 'deposits' has six; 'partnership' has three; 'resumption of gifts' has four; 'breach of service' consists of nine divisions; 'wages' has four divisions; there are two divisions of 'sales effected by another than the rightful owner';

The judicial proceedings in a case consisted of four stages, namely (1) the statement of the plaintiff (*purva-paksha*), (2) the reply of the defendant (*uttara-paksha*), (3) the actual trial, consisting of the evidence to establish the case and the arguments on both sides (*Kriya*), and (4) the decision (*nirnaya*).¹

Proceedings at law, according to Narada, were of two kinds: "Attended by a wager, or not attended by a wager. A lawsuit attended by a wager is where (either of the two parties) stakes in writing a certain sum which has to be paid besides the sum in dispute (in case of defeat)." ² This system of wager, however, is not to be found in other works, and probably in Narada's time only the remembrance existed of a custom which had died out long ago. It is interesting to note that the system of wagers in India was analogous to a similar custom in Rome in the earlier stages of the development of Roman legal procedure.

All civil actions as well as criminal cases were commenced by written petitions or verbal complaints made before the court by the aggrieved party. The date and the place of occurrence, the nature of the wrong done or of the claim made, and the names of the plaintiff (*urthi*) and the defendant (*pratyarthi*) were entered in the books of the court. ³ An important point for the court to determine at this stage was the capacity of the parties. If one of the parties was incapable of suing or

defending, the suit could not be proceeded with.

The first important step in the trial was the statement of the case by the plaintiff. ⁴ He had to cause the plaintiff to be put in writing, either by the officer of the court or by his legal adviser. A great deal of care, it seems, had to be taken in the preparation of the plaint, for Narada mentions the following as the defects of a plaint, namely "(1) if it relates to a different subject, (2) if it is unmeaning, (3) if the amount claimed has not been properly stated, (4) if it is wanting in propriety, (5) if the writing is deficient, or (6) redundant, (7) if it has been damaged." ⁵ A small verbal error, however, did not vitiate the plaint. ⁶ On the other hand, a plaint, though otherwise faultless, was held as incorrect if it was contrary to established law and usage. ⁷ The next step was the issue of summons for the attendance of the defendant. It was the duty of the defendant to attend the court on receipt of the summons; and if he attempted to abscond, the plaintiff might arrest him, to secure his presence in court. Such arrest might be one or other of four kinds, namely, local arrest, temporary arrest, inhibition from travelling, and arrest relating to his work. ⁸

The defendant, after having become acquainted with the tenour of the plaint, had to give a written reply. ⁹ A reply might be one or other of four sorts, namely, a denial (*mithya*), a confession (*samprati-patti*), a special plea (*pratyavaskandana*),

'non-delivery of a sold chattel' has a single division only; 'rescission of purchase' has four divisions; 'transgression of compact' is one-fold; 'boundary disputes' is twelve-fold; there are twenty divisions in 'mutual duties of husband and wife'; 'the law of inheritance' consists of nineteen divisions; 'heinous offences' of twelve; of both 'abuse' and 'assault' there are three divisions; 'gambling with dice and betting on animals' has a single division; 'miscellaneous' has six divisions." I. 20-25.

• 1 Brihaspati, III. 1-2. Vide also Sukraniti, IV. 5, 153. A good description of the actual proceedings in a criminal case is to be found in Sudraka's *Mrichchakatika*. Probably, this portion of the drama, like the rest, was based upon a much earlier work entitled 'Charudattam' by Bhasa; but, unfortunately, the whole of this latter book has not yet been discovered.

2 Narada (Jolly), Legal Procedure, 4.

3 Arthashastra, Bk IV. ch. 1. Yajñavalkya says that the representation, as made by the plaintiff, is to be put in writing in the presence of the defendant—the year, month, fortnight, and day, together with the names, caste, etc., being given.

1 "The accusation," says Narada, "is called the plaint: the answer is called the declaration of the defendant." Legal Procedure, 28. There were, according to Narada, two modes of plaint, "because a plaint may be either founded on suspicion or a fact." Ibid. 27.

2 Narada, Legal Procedure, II. 8.

3 Ibid. II. 25.

4 Ibid. II. 15.

5 Narada, Legal Procedure, 47. The following classes of persons, according to Narada, might not be arrested, namely, "one about to marry; one tormented of illness; one about to offer a sacrifice; one afflicted by a calamity; one accused by another; one employed in the King's service; cowherds engaged in tending cattle; cultivators in the act of cultivation; artisans while engaged in their own occupations; a minor; a messenger; one about to give alms; one fulfilling a vow; one harassed by difficulties."

6 The reply, according to Narada, was to correspond with the tenour of the plaint. Legal Procedure, II. 2.

a plea of former judgment (prannyaya).¹ Before the answer to the plaint was tendered, the plaintiff was at liberty to amend his plaint in any way he liked,² but after the delivery of the reply, no amendment was permitted. The plaintiff was entitled to submit a rejoinder to the defendant's reply.

If the case was a simple one, it was decided then and there. But if it was one which involved any important questions of fact or of law, and was not a matter of any urgency, the parties were given time to prepare their respective sides of the case.³ Where the defendant denied the charge or claim, the plaintiff had to prove his accusation or demand. Under certain circumstances, however, the burden of proof might be shifted from the plaintiff to the defendant.⁴ If the plaintiff failed to produce witnesses, or did not appear within three fortnights, he was non-suited. And if it was proved that the plaintiff had no just cause for bringing the suit, he was ordered to pay a fine. Counter-charges were not, as a rule, permitted. "One accused," says Narada, "of an offence, must not lodge a plaint himself, unless he has refuted the charge raised by the other party."⁵ But in certain classes of civil actions, such as disputes between members of a trade guild or between merchants, or in quarrels leading to duels, counter-suits were allowed.⁶ When two persons brought suits against each other, he was admitted as plaintiff whose grievance was the greater, or whose affair was the more important of the two, and not the person who was the first to go to law.⁷ A person who had already been accused by another person could not be accused by a different party

of the same offence, "for it is wrong to strike one again who has been struck (by another)."¹

Facts in a case were proved by evidence² which was either oral, or documentary, or real.³ In cases relating to property, possession was regarded as some evidence of ownership.⁴ Although all the forms of evidence were equally admissible, the oral evidence of witnesses was the commonest mode of proving a fact. Direct evidence was generally regarded as superior to circumstantial evidence, but in certain cases, e.g., theft and housebreaking, the latter was often the only kind of evidence available, and was held sufficient.⁵ It seems that hearsay evidence was not always excluded.⁶

The eligibility of witnesses was an important question. Householders, men with male issue, and natives of the country belonging to any of the few castes were regarded as eligible witnesses.⁷ Persons

1 Narada, I. 55.

2 In six cases, witnesses were held unnecessary, and indications of the crime committed were regarded as sufficient. "It should be known," says Narada, "that one carrying a firebrand in his hand is an incendiary; that one taken with a weapon in his hand is a murderer; and that where a man and the wife of another man seize one another by the hair, the man must be an adulterer. One who goes about with a hatchet in his hand and makes his approach may be recognised as a destroyer of bridges (and embankments); one carrying an axe is a destroyer of trees. One whose looks are suspicious is likely to have committed an assault. In all these cases, witnesses may be dispensed with; in the case of assault, careful investigation is required." I. 175. The indications may be regarded as constituting what is called 'real' and 'circumstantial' evidence.

3 "Evidence of guilt against a suspected person shall consist in the instruments used, his advisers and abettors, the article stolen, and any intermediaries." Arthashastra, Bk. IV. ch. 8. Vasistha says: "It is declared in the Smṛiti that there are three kinds of proof which give title to (property, viz.) documents, witnesses, and possession; (thereby) an owner may recover property which formerly belonged to him (but was lost)." He adds: In a dispute about a house or a field, reliance (may be placed on the depositions) of neighbours. If the statements of the neighbours disagree, documents (are) proof. If conflicting documents are produced, reliance (may be placed) on (the statements of) aged (inhabitants) of the village or town, and on (those of) guilds and corporations (of artisans and trades).

4 Cf. the English legal proverb, "Possession is nine points of the law."

5 Arthashastra, Bk. IV. ch. 8.

6 Manu says: "Evidence in accordance with what has actually been seen or heard is admissible." VIII. 74.

7 Manu, VIII. 62, Cf. Narada (I. 177-190), who gives a longer list.

1 Narada (Jolly), II. 4.

2 Ibid. II. 7.

3 Gautama says: "If (the defendant) is unable to answer (the plaint) at once, (the judge) may wait for a year. But (in an action) covering kine, draught-oxen, women, or the procreation (of offspring), the defendant (shall answer) immediately; likewise in a case that will suffer by delay." XIII. 28-30. Narada also advises the King to give time to the defendant except in urgent affairs, heinous offences, etc. I. 44-45.

4 For instance, "when the defendant has evaded the plaint by means of a special plea, it becomes incumbent on him to prove his assertion, and he is placed in the position of a claimant." Narada (Judicial Procedure), II. 31.

5 Narada Legal Procedure, 55.

6 Arthashastra, Bk. III. ch. 1.

7 Quotations from Narada (Jolly), I. 8.

who had an interest in the suit, familiar friends and companions, enemies of the parties, persons formerly convicted of perjury, persons suffering from some severe illness, and those tainted by mortal sin, were ineligible as witnesses.¹ And no person belonging to any of the following classes could be called as a witness, except under special circumstances: the King, mechanics, and actors, a student of the Veda, an ascetic, one wholly dependent, a person of ill repute, a dasyu, a person who followed forbidden occupations, an aged man, an infant, a man of the lowest caste, one extremely grieved, or intoxicated, one oppressed by hunger, thirst, or fatigue, a mad man, one tormented by desire, a wrathful man, and a thief.² The reasons why such persons were excluded from the witness box are thus indicated by Narada: "A child would speak falsely from ignorance, a woman from want of veracity, an impostor from habitual depravity, a relative from affection, and an enemy from desire of revenge." The ground on which some of the other classes were excluded appears to have been the desire on the part of the State to prevent, as far as possible, any interference with the ordinary vocations of the people. On failure of competent witnesses, however, the evidence of an infant, an aged person, a woman, a student, a relative, or a servant, might be offered.⁴

Uncorroborated evidence of a single witness was regarded as insufficient for the decision of a case, unless the witness happened to be a person possessed of exceptional qualifications and was agreeable to both the parties.⁵

Before the deposition of a witness was taken, it was the duty of the judge to

1 According to Vishnu, the proper witnesses are those born of a high family, possessing good qualifications or wealth, devoted to religious practices and sacrifices, those who have sons, who are versed in the law, who are truthful, who are devoted to study. Ch. 8 (Jolly's Sanskrit text).

2 Manu, VIII. 65-68.

3 I. 191.

4 Manu, 69-70. "But," adds Manu, "the judge should consider the evidence of infants, aged and diseased persons as untrustworthy, likewise that of disordered minds." VIII. 71. The competence of witnesses, in the opinion of Manu, should not be strictly examined in certain classes of criminal cases, e.g. violence, theft, adultery, defamation, and assault. VIII. 72.

5 Narada, I. 192; Manu, VIII. 77; Yajurveda, II. 72; Vishnu, VIII. 9.

impress on the witness the necessity of telling the truth, and the consequences, legal and moral, of telling a falsehood.¹ Witnesses were also charged on oath to speak the truth. According to Gautama, in the case of persons other than Brahmanas the oath was to be taken in the presence of the gods, of the King, or of the Brahmanas.² Perjury was regarded as a dire sin as well as a serious offence, and a witness who perjured himself was liable to be fined from one hundred to one thousand pausas, the exact amount of the fine depending upon the motive which induced him to give false evidence.³

Documentary evidence (lekhyā) was frequently resorted to in Ancient India, specially in civil actions. Vishnu mentions three kinds of documents, namely, (1) attested by the King's officers, (2) attested by private witnesses, and (3) unattested.⁴ According to Narada, a document, to be valid, should be signed by witnesses, the (natural) order of ideas and syllables should not be interrupted, local customs and general rules should be observed in it, and it should be complete in every respect.⁵

For the purpose of drawing conclusions from the evidence offered in court, it was the duty of the judge to weigh such evidence, and not merely to count the number of witnesses and documents on each side.⁶ Narada says: "There are some who give false evidence from covetousness, there are other villainous wretches who resort to forging documentary evidence. Therefore both sorts of evidence must be tested by the King with great care: documents according

1 Manu says that the judge should exhort the witnesses as follows: "A witness who speaks the truth in his evidence gains (after death) the most excellent regions (of bliss) and here (below) unsurpassable fame." "Such testimony is revered by Brahmana himself." And so on. Manu, VIII. 81-86. According to Gautama, Vasistha, and Boudhayana also, by giving false evidence a person incurs sin in varying degrees.

2 Gautama, XIII. 12-13.

3 Manu, VIII. 120-121. Megasthenes says: "A person convicted of bearing false witness suffers mutilation of his extremities." Fragment XXVII.

4 Vishnu (Jolly's Sanskrit text) Ch. V. Brihaspati says: "Writings are declared to be tenfold." V. 18.

5 Quotations from Narada, IV. 1.

6 Manu, however, says: "On a conflict of witnesses the King shall accept (as true) the (evidence of the) majority; if (the conflicting parties are) equal in number, (that of) those distinguished by good qualities; on a difference between (equally) distinguished (witnesses, that of) the best among the twice-born." VIII. 73.

to the rules regarding writings, witnesses according to the law of witnesses.¹ The means of arriving at the truth were regarded as four-fold, namely, 1. visible indications (pratyaksha), 2. reasoning (yukti), 3. inference (anumana), and 4. analogy (upamana).² If the witnesses disagreed with one another as to time, age, matter, quantity, shape, and species, such testimony was to be held as worthless. The judges were advised to note the demeanour of a witness in court and to draw an inference as to his veracity therefrom.³ But Narada, very wisely, cautions judges against accepting indications too readily. "Liars," says he, "may have the appearance of veracious men, and veracious men may resemble liars. There are many different characters. Therefore, it is necessary to examine (everything)." Safeguards were provided against the miscarriage of justice through belief in false evidence. And whenever it was found that the decision in a case was based upon false or insufficient evidence, the judgment was reversed, and all the proceedings in the case were declared null and void.⁴

The other modes of arriving at the truth, besides evidence, were the oath and the ordeal (divya). These methods, it seems, were resorted to only when evidence failed to establish the case one way or the other. As to the oath, Manu says, "let the judge cause a Brahmana to swear by his veracity, a Kshatriya by his chariot or the animal he rides on and by his weapons, a Vaisya by his kine, grain, and gold, and a Sudra by (imprecating on his own head the guilt) of all grievous offences."⁵ The ordeal was a divine test.⁶ It was used in criminal cases, and was of various kinds, such as (i) by the balance, (ii)

by fire, (iii) by water, and (iv) by poison.⁷ If the accused person was unhurt, or did not meet with any speedy misfortune, he was held to be innocent.⁸ Resort was had to the expedient of the ordeal when both the parties failed to bring witnesses, or to produce documentary evidence, and the merit of the case was so doubtful that the judges felt disinclined to take upon themselves the responsibility to give a decision.⁹ These methods were thus used only on rare occasions, and they became obsolete in course of time, leaving evidence as practically the sole method by which the court arrived at the right decision as to the guilt or innocence of an accused person.

Sometimes judicial investigation supplemented the information obtained by evidence offered in court. But great care was taken against an abuse of this method. Hsien Tsiang emphatically states that "in the investigation of criminal cases there is no use of rod or staff to obtain proofs."¹⁰

The next stage of the trial was the argument on both sides. When the parties themselves were persons unacquainted with the law, they were sometimes represented for the purpose of arguing the case

1 Manu, VIII. 114. Vishnu and Narada give detailed descriptions of the different kinds of ordeal. Hsien Tsiang, who was perhaps an eye-witness of ordeals, thus describes them: "When the ordeal is by water, then the accused is placed in a sack connected with a stone vessel and thrown into deep water. They then judge of his innocence or guilt in this way—if the man sinks, and the stone floats, he is guilty; but if the man floats and the stone sinks, then he is pronounced innocent. Secondly, by fire: They heat a plate of iron, and make the accused sit on it, and again place his feet on it, and apply it to the palms of his hands; moreover, he is made to pass his tongue over it; if no scars result, he is innocent; if there are scars, guilt is proved. In case of weak or timid persons who cannot endure such ordeal, they take a flower-bud and cast it towards the fire; if it opens he is innocent; if the flower is burnt, he is guilty. Ordeal by weight is this: A man and a stone are placed in a balance evenly; then they judge according to lightness or weight. If the accused is innocent, then the man weighs down the stone, which rises in the balance; if he is guilty, the man rises, and the stone falls. Ordeal by poison is this: They take a ram, and make an incision in the thigh (of the animal); if the man is guilty, then the poison takes effect, and the creature dies; if he is innocent, then the poison has no effect, and he survives. By these four modes of trial, the way of crime is stopped." Beal, Buddhist Records, Bk. II.

2 Manu, VIII. 115.

3 Vide Abul Fazl's *Ayecn-i-Akbery*, p. 495.

4 Buddhist Records, (Beal), Bk.

1 Narada, *Legal Procedure*, 70.

2 Sukraniti, II. 93.

3 "If a man being questioned does not uphold a statement duly made by himself (at a former stage of the trial); or if he ends by admitting what had been previously negated by himself; or if he is unable to produce any witnesses after having declared that they are in existence, and having been asked to produce them; by all such signs as these, persons devoid of virtue may be known." Narada, *Legal Procedure*, 61.

Abul Fazl, describing the Hindu system of administration of justice, says: "The judge will derive collateral proof by the physiognomy and prevarication of the party." *Ayecn-i-Akbery* (Gladwin), p. 496.

4 Manu, VIII. 117.

5 'Divya' is a term not found in early Vedic literature.

6 Manu, VIII. 113.

by their relatives, or friends, or professional lawyers (*pratinidhi*).¹ Such representation, it seems, was usual in the civil suits and in the less serious criminal cases, but no representation was permitted in the graver criminal offences, such as murder, adultery, abduction, forgery, sedition, robbery, and theft.²

Judgment was delivered at the end of the hearing of a case. In applying the law to a particular case, the judges were expected to take into consideration all the circumstances. "No sentence," says Brihaspati, "should be passed merely in accordance with the letter of the law. If a decision is arrived at without considering the circumstances of the case violation of justice will be the result."³ The judgment was embodied in a document, a copy of which was furnished to the victorious party.⁴

The remedies given by the courts depended upon the character and circumstances of each case. In civil actions, the usual remedies were restoration of property and fines. The courts had also power to declare agreements as invalid. Thus, for instance, contracts entered into under provocation, compulsion, or intoxication, or by dependents, infants, aged persons, and lunatics, were often held as void.⁵ In an action for the recovery of debts the court had the power to modify the whole transaction, and to grant only a reasonable rate of interest. In criminal cases, the punishments were :⁶ (i) fine, (ii) im-

prisonment, (iii) whipping, (iv) physical torture, (v) banishment, (vi) condemnation to work in the mines, and (vii) death.

The punishment awarded in criminal cases corresponded to the nature of the offence.⁷ The extreme penalty of death was rarely inflicted,⁸ and any other kind of corporal punishment was uncommon. "The King," says Fa Hian, "in the administration of justice inflicts no corporal punishment, but each culprit is fined in money according to the gravity of his offence, and even in cases where the culprit has been guilty of repeated attempts to excite rebellion, they restrict themselves to the cutting off of his right hand." This statement is confirmed by Hsuen Tsiang and Sung Yun. Hsuen Tsiang says: "There is no infliction of corporal punishment; they are simply left to live or die, and are not counted among men."⁹ Megasthenes mentions cropping of the hair as a punishment. If one is guilty," says he, "of a heinous offence, the King orders his hair to be cropped, this being a punishment in the last degree infamous."¹⁰

Sureties (*pratibhu*)¹¹ for good behaviour were also sometimes taken from persons found guilty of criminal offences. Abettors of a crime were punished in a manner similar to the punishment provided for the principal offender.

The extra-judicial remedy of self-help was also recognised by the courts within reasonable limits. Manu, for instance, says: "By moral suasion, by suits of law, by artful management, or by the customary proceeding, a creditor may recover property lent; and fifthly, by force. A creditor who himself recovers his property from his debtor must not be blamed by the King for retaking what is his own."¹²

If any person was dissatisfied with the judgment, and thought that the case had been decided in a way contrary to justice, he might have it re-tried on payment of a fine. Narada says: "When a lawsuit has been judged without any previous exami-

1. Sukraniti, IV. 5, 110. According to Sukra, the lawyer's fee was to be one-sixteenth of the value of the suit. IV. 5, 114.

Narada says: "He deserves punishment who speaks in behalf of another, without being either the brother, the father, the son, or the appointed agent." Narada (Judicial Procedure), II., 23.

2. Sukraniti, IV. 5, 120.

3. Brihaspati, II. 12.

4. Narada says: "The victorious party shall receive a document recording his victory, and couched in appropriate language." Legal Procedure, II. 43. Brihaspati says: "Whatever has been transacted in a suit, the plaint, answer, and so forth, as well as the gist of the trial, should be noted completely in the document recording the success (of the claimant or defendant)."

5. Arthashastra, Bk. III. ch. 1.

6. Narada says: "Punishment is pronounced to be two-fold: bodily punishment and fines. Bodily punishment is declared to be of ten sorts, fines are also of more than one kind. Fines begin with a *Kakani*, and the highest amount is one's entire property. Bodily punishment begins with confinement, and ends with capital punishment." Jolly, Appendices, 53-54.

1. Brihaspati VI. 2.

2. Sung Yun, speaking of the Kingdom of Udyana (Kashmir), says: "Supposing a man has committed murder, they do not suffer him to be killed, but banish him to the desert mountains." Buddhist Records, p. 188.

nation of witnesses (or other evidence), or when it has been decided in an improper manner, or when it has been judged by unauthorised persons, the trial has to be renewed."¹ An appeal also lay from the decision of an inferior court to a higher tribunal, where the whole case was re-tried.²

We now pass on to a consideration of some of the important features of the administration of justice in Ancient India. The first characteristic that strikes the enquirer is the responsibility of the judges and their independence. The judges had to perform their duties in accordance with the law, and it was their duty to deal out equal justice to all.³ If they transgressed the laws, or acted improperly in the discharge of their duties, they not only incurred sin,⁴ but were liable to be punished. Chanakya prescribes punishment for any unrighteous behaviour on the part of the judges. "If a judge," says he, "chides or threatens or sends out or unjustly silences a litigant, he shall be liable to the first amercement. If he defames any litigant, his punishment shall be double the amount. If he does not ask any questions which ought to be asked, or asks questions which ought not to be asked, or having asked a question, leaves it out, or tutors a witness, or reminds him what he said before, he shall be liable to the second amercement. If he does not enquire into relevant matters or enquires into irrelevant matters, or unnecessarily delays the trial, or maliciously postpones business, or makes one of the parties leave the court disgusted and tired, or leaves out statements which may lead to a right decision, or lends assistance to the witnesses, or takes up a case already decided, he shall be liable to the first amercement. On a repetition of the offence, his punishment shall be double, and he shall be

removed from office."⁵ So also, Yajñavalkya says: "If the members of the judicial assembly give any decisions contrary to law and custom, through affection, temptation, or fear, each of them would be liable to double the punishment provided for the case."⁶ But if the responsibility of the judges was great, so was their independence. The law was their only master and guide, and they had power to deal equally with the high and the low. The administration of justice was kept separate from the executive functions of the State, and no interference with judicial business by the executive was permitted.

Another feature of the judicial system was that every person resident in the country, whatever his position might be, and whether he was a native or a foreigner,⁷ received the protection of the courts. Such protection was, of course, specially appreciated by the weaker members of society. If a *dasa*, for instance, was ill-treated, he was permitted by the courts to leave his master, and the courts inflicted a punishment on the master if he failed to liberate the *dasa* on receipt of a ransom.⁸ So also, servants were protected from ill-treatment at the hands of their masters. A servant could, with the help of the courts, enforce the payment of his wages, and any agreement made between master and servant to the prejudice of the latter was liable to be set aside by the courts.⁹

The third feature of the legal system is not one which is very pleasing to note. Although every member of the society had a *locus standi* in the courts, the idea of equality before the law was not fully developed in Ancient India. A modified form of privilege ran through the whole system of Hindu Jurisprudence. The law was not the same for all, but depended upon the status of the person concerned. If a man belonging to one of the higher

¹ Quotations from Narada (Jolly), I. 14.

³ Manu, VIII. 13-14.

⁴ Manu says: "When any injustice is done, one-fourth of the sin attaches to the wrong-doer, one-fourth to the witness, one-fourth to the judges, and the remaining fourth to the King." VIII. 18. Abul Fazl, speaking of the administration of justice in Hindu India, says, "He (the judge) must consider it a religious obligation to discharge the duties of his office with impartiality and justice." Ayeen-i-Akbery (Gladwin), p. 405.

⁵ 1 Arthashastra, Bk. IV. ch. 9. Kautilya says further: "If the judge, or the director, unjustly fines anybody, he shall be fined twice the amount. If he condemns any person unjustly to bodily punishment, he shall himself suffer the same punishment, or be fined twice the amount of the ransom payable."

⁶ II. 4. Some of the other *Smṛiti* works also prescribe punishments for judges who transgress the law.

⁷ Vide Arthashastra, Bk. IV. ch. 2.

⁸ Arthashastra, Bk. III. ch. 13.

⁹ Arthashastra, Bk. III. ch. 14.

castes committed an offence, his punishment was lighter than what would be inflicted on a man of a lower grade for a similar offence. As an instance may be mentioned the fact that the Brahmanas, as a rule, enjoyed immunity from the more degrading kinds of punishment provided for criminal offences.¹

From the records preserved in Indian literature as well as from the accounts left by foreign travellers, it seems quite clear that the administration of justice was very efficient in Ancient India. This must have been the result of three factors, namely, the uprightness of the judges, the efficiency of the police, and the general honesty and probity of the people. Judges were recruited from the class of learned Brahmanas who were noted for their high character and purity of life. Adequate measures were taken to secure the efficiency

of the police force. As for the last factor, the testimony of the most eminent foreign observers is conclusive. "Theft," says Megasthenes, "is of very rare occurrence... The simplicity of their laws and their contracts is proved by the fact that they seldom go to law. They have no suits about pledges or deposits, nor do they require either seals or witnesses, but make their deposits, and confide in each other. Their houses and property they generally leave unguarded. These things indicate that they possess good, sober sense."² This statement is confirmed by Hiuen Tsiang, the great Chinese monk, who travelled in India a thousand years after Megasthenes. His words are: "With respect to the ordinary people, although they are naturally light-minded, they are upright and honourable. In money matters they are without craft, and in administering justice they are considerate. They dread the retribution of another state of existence, and make light of things of this world. They are not deceitful or treacherous in their conduct, and are faithful to their oaths and promises. In their rules of government there is remarkable rectitude, while in their behaviour there is much gentleness and sweetness."³

¹ Fragment XXVII.

² Hiuen Tsiang's Travels, Buddhist Records (Beal), Bk. II.

³ Gautama says: "A learned Brahmana (i.e. one deeply versed in the Vedas and other branches of learning), must be allowed by the King immunity from the following six (kinds of opprobrious treatment): he must not be subjected to corporal punishment, he must not be imprisoned, he must not be fined, he must not be exiled, he must not be reviled, nor be excluded" VIII. 12-13. But Kautilya says: "When a Brahmana has committed a crime, he should be branded, his crime should be proclaimed in public, his property should be confiscated, and he should be condemned to work in the mines." Arthashastra, Bk. IV. ch. 18. In the *Mricchakatika* we find that the sentence of death passed on a Brahmana becomes the immediate cause of a revolution.

THE IDEALS OF THE ANCIENT HINDU STATE

BY NARENDRA NATH LAW, M. A., B.L., PREMCHAND ROYCHAND SCHOLAR.

III.

GOVERNMENT, ACCORDING TO THE HINDU CONCEPTION, IS AN ORGANIZATION TO PROMOTE THE MATERIAL AND SPIRITUAL WELFARE OF THE PEOPLE THROUGH A DUE REGULATION OF CONFLICTING AND DIFFERENT INTERESTS THAT MAKE UP SOCIETY.

GOVERNMENT like all other concerns of life is associated in the eye of a Hindu with an ultimate spiritual purpose. A well-conducted government forms the basis, without which

the aggregate spiritual progress of the people in an orderly and effective way is not possible. Hence comes the great responsibility of a monarch, who as the head of a royal polity, works this important machinery, which being out of order, affects not merely the material interests of the people but also their spiritual interests, the latter being regarded by them as far superior to the former. The successive links by which government is chained up to the *summum bonum* are the four castes viz., Brāhmana, Kshatriya, Vaisya and Sūdra com-

posing the society have arts and sciences to learn and duties to follow in and through the prescribed modes of life, which ultimately leads them to salvation. For a strict adherence to the duties, and for punishment of deviations¹ therefrom, as also for the protec-

tion and maintenance of order among the people, an organization is needed; and this is supplied by the ruler.

THE EVILS OF A STATE WITHOUT GOVERNMENT.

Without him, anarchy¹ prevails bringing

1. According to Kautilya, there are four branches of learning: viz. (I) *anvikshiki* (II) *trayi* (III) *varta* and (IV) *dandaniti* (Bk. I, *Vidyasamuddesa*, pp. 6ff.) The first comprises the three branches of metaphysics viz. *Saṅkhyā*, *Yoga* and *Lokayata*. The second literally means "triple" i.e. the three Vedas *Rīg*, *Tajus* and *Sāma*; but the signification is extended to include also the *Atharva Veda* and *Itihāsa-Veda* which according to Kautilya's explanation (Bk. I, *Vridhasamyogah*, p. 10) consists of (a) *Purāṇa*, (b) *itihāsa* (history), (c) *ākhyayikā* (legends), (d) *udāharana* (illustrations), (e) *dharmaśāstra* (codes of law and morals), and (f) *Arthasāstra* of which Kautilya thus marks out the scope—*manuṣhyāṅgaṃ vṛttirarthah; manuṣhyavatu bhumintyarthah; tasyaḥ prithivyā lābhapālānopayāḥ sāstramārtha—sāstramiti* (Bk. XV, *tantrayuktayah*, p. 224) which means "artha (wealth or 'goods') is the object of man's desire; the inhabited land (or country) is *artha*; that science which treats of the means of the acquiring, preserving and developing of the said land or country is *Arthasāstra* (science of wealth), which thus includes the ground covered by the modern sciences of economics and politics. The six *Angas* are of course studied along with the *Vedas*—viz., *sikshā* (phonetics), *kalpa* (rules for rituals), *vyākaraṇa* (grammar), *nirukta* (etymological explanation of difficult Vedic terms), 'chhanda' (prosody) and *gyotish* (astronomy). [Bk. I, p. 7.] The third is economics primarily concerned with agriculture, cattle-breeding and trade, while the fourth is science of Government. Nilakantha has the following comments on the 'Santiparva', ch. 59, slk. 33 "trayī-karmakāṇḍah. Anvikshiki jñānakāṇḍah. Vartā krishivāṇijyādi jivikā-kāṇḍah. Dandanitih pālana-vidyā". About the relative importance of these subjects of human learning, there are differences of opinion, which are indicated by the classification of learning followed, Kautilya like Kāmandakiya dividing it into four branches ('Kāmandakiya-Niṣāra, sarga 2, slks 1, 2 and 6), the school of Manu as three, subsuming (I) under (II), that of Brihaspati as two viz., (III) and (IV), that of Usanas as (IV) alone viz., dandaniti, the other three being but its dependents (see *Arthasāstra*, Bk. I, *Vidyasamuddesa*, p. 6; also Kāmandakiya, sarga I, slks. 3-5). In the *Rāmāyana*, the divisions of learning are mentioned as three (*Ayodhyakāṇḍa*, sarga 100, slk. 68—"ashtavargam trivargam cha vidyāṁśascha raghava"). In 'Manu', VII, 43, the *vidyās* are five, if 'anvikshiki' and 'atma-vidyā' be taken as separate, as some commentators have done, and in 'Yājñavalkya' the 'vidyās' are four (I, 311, M. N. Dutta's ed.) Kāmandaki follows Kautilya in fixing the number at four using 'atma-vidyā' as explanatory of 'anvikshiki' (sarga 2, slk. 11). Cf. *Raghuvansa*, III, 30, which mentions four 'vidyās'. According to some, 'vidyā' has fourteen or eighteen divisions; others reckon thirty-three or even sixty-four. The principal branches however are the four indicated above. The object of the first division of learning

is, as Kāmandaki (*sarga 2, slk. 11*) explains, to create non-attachment to this world, that of the second to enable to distinguish between righteousness and non-righteousness, of the third to impart a knowledge of economics, and of the fourth to make one well-versed in the science of government. Cf. 'Agni-Purāṇa', *Anvikshikiyāntu vijñānam dharma-dharmau trayisthitau. Arthanarthau varṇāyām dandanityām nayāṇayau*, ch. 238, slk. 9.

These four branches of learning are the means by which the people are to secure the forefold objects of human existence, viz., 'dharma', 'artha', 'kāma' and 'moksha', i.e., the fulfilment of legitimate desires in a legitimate way through the means acquired also in a legitimate way, which ultimately leads to salvation. This is not possible without the practical application of the science of Government by a ruler. Hence his importance. [For the paramount importance of 'Rajadharma', see M. Bh. 'Santiparva', ch. 63, slks. 24-30.] He it is who checks all deviations from the proper courses marked out for the people for performing their duties for the attainment of the ultimate object. The respective duties of the four castes are laid down in the 'Kautilya' at Bk. I, p. 7. 'Vidyasamuddesa', along with the four modes of life, viz., of student, householder, forest-recluse and wandering mendicant' (pp. 7, 8, *Ibid*)

1. 'Kautilya uses the pithy expression' *mātsya-nāya* which reigns supreme in the absence of a ruler, the stronger destroying the weak like the large fishes preying on the small fry. In the 'Rāmāyana', the idea occurs in *Ayodhyakāṇḍa*, sarga 67, slk. 31, where the banefulness of anarchy is delineated—

Narajake janapade svakam bhavati kasyachit,
Matsya iva janā nityam bhakshayanti paraspāram.

Cf. 'Ayoḍhyakāṇḍa', sarga 61, slk. 22—where the phenomenon is thus referred to—*svayameva hatah pitṛa jalajenātmaṇo yataḥ*. The *Mahabharata* in a similar context has *Rajachennabhavelloke prithivyām dandadhārakah, jāle matsyāṇi vā bhakshyan durvalam valavattarāḥ*—'Santiparva', ch. 67, slk. 16.

Cf. 'Matsya-Purāṇa' which has
Bala-vridhdhatura-yati-dvija-stri-vidhava yataḥ,
Matsyanyāyena bhakshyeran yadi dandam na patayet.
ch. 225, slk. 9.

The Kāmandakiya has *dandabhāve paridhvamsi mātsyonyāyah pravartate*. *Sarga 2, slk. 40*.

The expression also occurs in the inscription of Dharmapāla at Khālīmpura [Gunda-lekha-māṇā, p. 12]. Various meanings of the expression are given at p. 148 of the *History of Bengal* (in Bengali) by Mr. R. D. Bannerjee, M.A.

The evils of anarchy are vividly depicted in the 'Rāmāyana', 'Ayodhyakāṇḍa', ch. 67; 'Mbh.' 'Santiparva', chs. 67, 68. Just as anarchy is deprecated, so

in its train the evils *that are so much dreaded by mankind.*

is ruling with an iron hand or a mild one. Cf. 'Arthashastra', Bk. I, Vidyasamudgesah, p. 9, which has been verified almost verbatim in the Kāmandakiya.

Prof. Hopkins refers to these evils of anarchy in 'J. A. O. S.', xiii, p. 136, but he confuses "autonomous (kingless)" states with those in which anarchy prevails. The Vedic term for anarchy is 'arajata' (see V. I, 125).

REVIEWS

THE HINDU LAW OF ADOPTION—By Golapchandra Sarkar, Sastri, M.A., B.L., (Former Lecturer for 1888). Edited by Raghunath Srinivasa M.A., B.L., Fakir, High Court, Calcutta. Published by R. Cambay & Co., 9, Hastings Street, 1916.

This new edition of the well-known work of Pandit Golapchandra Sarkar Sastri requires no introduction to the public. The very fact that a second edition has been called for shows the usefulness of this book to the legal public. It is a matter of regret that the learned author did not live to see this work through the press. It has, however, been very ably edited by his son, who has brought it up to-date by giving references to all cases since decided, in the foot-notes.

In connection with this we may mention that it would have been better, if the editor had given fuller references in the foot-notes. Thus at page 6, the reference to Mitaksara is "Bombay Edition, p. 225, original." There are several Bombay editions of Mitaksara, and without further specification it is not possible to find out to what edition the reference is made. It is not certainly at p. 225, of Gharpure's Edition of 1914, nor in the Edition of Shivaram Janardana Sastri Gore of 1887, nor in that of Wasudeva Laxman Shastri Pansikar of 1909. The better way of giving such references would be to give the reference of the original verse of Yajñavalkya, on which Vijnanesvara is commenting.

So also it would have been better to give more copious references. Thus at the same page 6, we find that reference is made to Balambhatta, and it is said "that a boy who has been given and taken, but whose adoption fails on this ground or on the ground of its being in contravention of other rules relating to the subject, is pronounced by Balambhatta, Nanda Pandita and Jagannatha to become a slave of the adopter." It is not shown where Balambhatta makes this pronouncement, though references to Nanda Pandita and Jagannatha are given.

The author starts his lectures by the statement—"The usage of Adoption is the survival of an archaic institution which owed its origin to the principle of slavery, whereby a man might, like the lower animals, be the subject of dominion or proprietary right, might, in fact, be bought and sold, given and accepted, or relinquished in the same way as a cow or a horse." This is the generally adopted view of modern historians. But in the case of India, it may not be true. The oldest reference to adoption is in the Aitareya Brahmana, where in VII. 13 to 18 the story of Sunahsepha is given. It is on this story that the whole fabric of adoption is based. That the son was

not treated as a slave is to be found in the very opening verses of that story, where it is emphatically said, "The father pays a debt in his son, and gains immortality, when he beholds the face of a son living who was born to him." "The pleasure which a father has in his son, exceeds the enjoyment of all other beings, be they on the earth, or in the fire, or in the water." "Fathers always overcome great difficulties through a son. (In him) the Self is born out of Self. The son is like a well-provisioned boat, which carries him over." "What is the use of living unwashed, wearing the goatskin, and heard? What is the use of performing austerities? You should wish for a son, O Brahmins!" "Thus people talk of them (who forego the married life on account of religious devotion)." "Food preserves life, clothes protect from cold, gold (golden ornaments) gives beauty, marriages produce wealth in cattle; the wife is the friend, the daughter object of compassion, but the son shines as his light in the highest heaven."

So also Apastamba (II. 9, XXIV. 1 et seq) says:—"Now the Veda declares also one's offspring to be immortality (in this verse): 'In thy offspring thou art born again, that mortal, is thy immortality.'" Here also the son is said to be the immortality of the father. In fact, we may search in vain throughout the whole of ancient Sanskrit literature for an explicit statement, that the son was the slave of the father.

It was only in cases of extreme necessity that parents could give away their sons in adoption. Thus Manu (IX. 168) says:—"That (boy) equal (by caste) whom his mother or his father affectionately give, (confirming the gift) with (a libation of) water, in times of distress (to a man) as his son, must be considered as an adopted son (Dattima)." Thus Balambhatta, in commenting on the Mitaksara, Yajñavalkya's verse 13) of the Vyavahara Adhyaya, says, "He, who through extreme misfortune is unable to support (may give away his son in adoption)." (See Gharpure's Balambhatti, Vyavahara Adhyaya, p. 171, "बोद्धव्यं दुर्गता भरणसामर्थ्येन")

No doubt, slavery is recognised in the law, as found in modern compilations like Manu and Narada. There we do not see any trace that adoption was treated as a slavery. Adoption arises only among those people who know the value of a son and can appreciate him properly. It was only a modern fad of some orientalists, who trace adoption to slavery and marriage to captivity in war. They totally forget that the instincts which lead a person to adopt a son or to marry a wife, are totally distinct from the instincts which make on

purchase a slave, or commit adultery. It is a universal instinct and a beneficent instinct, this instinct of adoption. It is found in some animals also. Only the other day the pet cat of my nephew gave birth to four kittens. Two of these were given away after some days to a friend. The poor cat mewed about the whole house for two nights, and on the third day she brought a kitten, God knows whence, and adopted it and treats it as if it were her own child.

At page-10, the author describes the difference between Daiva and Prajapatya form of marriage. He says, "In the Prajapatya form the bride is given to a person with an agreement that the donee is to treat her as a partner for secular and religious purposes, and the proposal comes from the bridegroom who is a suitor for the damsel. The existence of the condition restricting the husband's freedom of action was perhaps the reason why this form is considered to be inferior to Arsa and Daiva."

The real difference, however, between the Prajapatya and other forms of marriages, has not been fully brought out by the learned author. While in other approved forms of marriages, a husband could take another wife during the life-time of his first wife, he could not do so, if the marriage was in the Prajapatya form. Monogamy was the essence in this form of marriage. Thus Balambhatta, in commenting on Yajñavalkya, Acharya Adhyaya, verse 60 (p. 201 of Gharpure's Balambhatti) quotes Haradatta and Nrisimha :—

यद्यन्येषूपि विवाहेषु सहषर्मादिवरणमस्ति तथाप्यत्र
यावज्जीवं तदेव न तु मध्ये आश्रमान्तपरिग्रहः स्यन्तपरिग्रहः
वेति विशेषः."

The full text of Haradatta is given below :—

"प्राजापत्यसंज्ञके विवाहे सहषर्माद्यर्थतामिति प्रदानमन्त्रः ।
यद्यपि ब्राह्मादिषुपि सहषर्माद्यर्था भवति तथाऽप्यात्तादनया सह
षर्मादितयः । नाश्रमान्तरं प्रवेष्टव्यं नापि स्यन्तरमुपयन्तव्य-
मिति मन्त्रेण समयः क्रियते । एष ब्राह्मादेः प्राजापत्यस्य विशेषः
आधादाव्यक्ततामिति समानम् ।"

(Gautama IV. 7, Haradatta's commentary). The above passage may be freely translated thus :—

"At the marriage called Prajapatya, the formula in giving away the daughter is :—'Fulfil ye the law conjointly.' Though in marriages, under Brahma rites and other, the fulfilment of law conjointly does also take place, yet, here up to the end, the law should be fulfilled with her. The husband should not take to another Ashrama, (i.e., should not become a Sannyasin), nor should he marry another wife—this is the contract made by this formula. This is the specific difference between the Prajapatya and other forms of marriages like Brahma and the rest."

Thus, the essential feature of this Prajapatya rite consisted in this contract (Samaya) to observe monogamy, and never to forsake the wife.

Nor is the learned author right in saying that the Prajapatya form is considered inferior to Arsa and Daiva. It is not only not inferior, but it is distinctly superior to them, according to Gautama (IV. 7 and 6). He mentions it as second in the list of marriages, the first being Brahma. Thus he says :—"If the father gives (his daughter) dressed (in two garments) and decked with ornaments to a person possessing (sacred) learning, of virtuous conduct, who has rela-

tives and a (good) disposition, (that is a) Brahma (wedding)." At the Prajapatya (wedding) the marriage-formula is, 'Fulfil ye the law conjointly.'

No doubt, Manu (III. 21) says about the eight forms of marriages :—"They are) the rite of Brahma (Brahma), that of the gods (Daiva), that of the Risis (Arsa), that of Prajapati (Prajapatya), that of the Asuras (Asura), that of the Gandharvas (Gandharva), that of the Raksas (Raksasa), and that of the Pisachas (Pisacha)." He has placed here the Prajapatya as fourth in order, but that does not indicate that the Prajapatya is inferior to the Daiva and the Arsa rites. In III. 38, he says that a son born of a wife, according to the Daiva rite, saves seven ancestors and seven descendants. The son of a wife married by Arsa rite saves three ancestors in the ascending and descending lines, and the son of a wife married by Prajapatya rite saves six ancestors in either line. Thus according to Manu even, the Prajapatya form is superior to Arsa, because in the Prajapatya rite six ancestors are saved, while in the Arsa rite three only. While according to Gautama, Prajapatya is mentioned just after the Brahma, and in Gautama IV. 30 et seq., we find :—"A son born of a wife married) according to the Arsa rite (saves) three ancestors (from hell). (A son born of a wife married) according to the Daiva rite, ten. (A son born of a wife married) according to the Prajapatya rite, also ten. (But) the son of a wife married according to the Brahma rite (saves) ten ancestors, ten descendants and himself."

The above extract from Haradatta's commentary, and the marriage-mantra in Prajapatya form, disproves the following assertion of the learned author at page 11 :—"The primitive conception of marriage consisting in the acquisition of dominion over a woman, and wives being regarded as a sort of possession, there was no limit to the number of wives a man might have; he could have as many as he might afford to procure by the different modes pointed above. Under such circumstances mutual fidelity could not form any part of the marital relation; looseness of the marriage tie and laxity in sexual morality must necessarily prevail. Any idea of fidelity, sentiment or delicacy did not exist as an element of marriage union, and a husband appears to have had no great objection to allow his wife to be approached by other men."

The last sentence certainly gives a wrong idea of ancient Hindu society, and is not authorised by Vedic texts. The learned author has quoted Apastamba, Sacred Books of the East, Vol. II, p. 130. The full text of Apastamba (II. 6. 13. 7) is given here :—"Now they quote also (the following Gatha from the Veda) : '(Having considered myself) formerly a father, I shall not now allow (any longer) my wives (to be approached by other men), since they have declared that a son belongs to the begetter in the world of Yama. The giver of the seed carries off the son after death in Yama's world, therefore they guard their wives, fearing the seed of strangers. Carefully watch over (the procreation of) your children, lest stranger seed be sown on your soil. In the next world the son belongs to the begetter, an (imprudent) husband makes the (begetting of) children vain (for himself)."

This text, certainly, does not authorize the sweeping statement to the effect, that the husband had no great objection to allow his wife to be approached by other men. The Gatha above quoted refers to the ancient controversy, to whom did the Ksetraja child belong—to the Bijin, to the begetter, or to the Ksetrin, the husband. The commentary of Hara-

datta, on this Sutra, makes it clear. The purport of this commentary is given by Dr. Bühler under the Sutra quoted:—"According to Haradatta this Gatha gives the sentiments of a husband who neglected to watch his wives, and who had heard from those learned in the law that the sons of his unfaithful wives would in the next world belong to their natural fathers, and that he would not derive any spiritual benefit from their oblations. He adds that this verse does not refer to or prevent the appointment of a eunuch's wife or of a childless widow to a relation. He also quotes a passage from the Srauta-Sutra I, 9, in which the dvipita, 'the son of two fathers,' is mentioned."

The next text quoted by the learned lecturer in support of his proposition is Baudhayana (Sacred Books of the East, Vol IV. p. 229).

That text also does not support his proposition. It occurs in Baudhayana (II. 2. 3 31 et seq.) in connection with various kinds of sons. We give the full text below:—"Now they quote also (the following verses): 'They declare the legitimate son, the son of an appointed daughter, the son begotten on a wife, the adopted son and the son made, the son born secretly, the son cast off, (to be entitled) to share the inheritance.' 'They declare the son of an unmarried damsel and the son received with the bride, the son bought, likewise the son of a twice-married female, the son self-given and the Nisada, to be members of the family. 'Apajandham (declares that) the first among them alone is (entitled to inherit, and a member of his father's family.' 'Now, O Janaka, I jealously watch my wives, (though I did) not (do it) formerly; for they have declared in Yama's court that the son belongs to the begetter. The giver of the seed carries off the son, after death, in Yama's hall. Therefore they carefully protect their wives, fearing the seed of strangers.' 'Carefully watch (the procreation of your) offspring, lest strange seed fall on your soil. After death the son belongs to the begetter, through carelessness a husband makes (the procreation of) a son useless.'"

The proper conclusion to draw from these passages is that in ancient times women had more liberty, and mixed freely in society and were not secluded in the Zenana. No doubt, some women abused the liberty given to them, and these texts are the thin end of the wedge which introduce the parda system into India. There is no proof that the husbands looked with complacency, far less permitted, infidelity in their wives.

It may be mentioned here, in passing, that Apastamba, at least, does not permit even the gift of a son in adoption. He says (II. 6. 13, 10):—दानं क्रयवर्ण-
वापव्यस्य न विद्यते", the gift, and the right to sell child, are not recognised.

Haradatta commenting on this Sutra, no doubt, modifies this text, by saying that the gift of a son in adoption must be recognised, though the gift of a son should not be recognised in the Visva-jit-yaga, where a man gives away all his property. He is emphatic in his declaration that a son can never be sold.

"विश्वजितौ च सर्वस्वदाने गवादिपदस्य न दैयम् । विक्रयस्तु सर्वस्य निषिद्धः ।"

Vajnavalkya also (III. 236) makes the sale of a son an Upapataka sin.

RANENDRANATH BASU.

MOHAMMEDAN THEORIES OF FINANCE WITH AN INTRODUCTION TO MOHAMMEDAN LAW AND A BIBLIOGRAPHY by *Nicolas P. Agnides*. Price \$4.00. New York, Columbia University.

Since the year 1891 the Faculty of Political Science of Columbia has issued a succession of monographs on different questions of History, Economics and Public Law, and this is the seventieth volume of the series. In accordance with the character of the series it is meant for the advanced student and specialist, not for the beginner or general reader. No other work covering the same ground exists in any European language, although the subject of finance has been touched on incidentally in some translations of Mohammedan legal text-books. As the style is extremely concise, a great mass of information is condensed in the 535 pages of this volume.

The book consists of two parts, the first giving a brief account of Mohammedan law, and the second dealing with the proper subject-matter of the work, finance. The law of Islam rests on four bases, the Quran, the Sunnah, Ijma' and Qijas. As to the Quran all scholars, Muslim and European, are agreed that we have in it with scarcely any change the words uttered by Mohammad in a state of inspiration. But the Quran alone would not be sufficient for the decision of every question. It is supplemented by the Sunnah or rules of conduct derived from the acts and sayings of the Prophet. For a prophet is divinely guided in all his acts and sayings. "The only difference between the ordinary expressions of the prophet and his revelations consists in the fact that whereas the former are divine in content alone, the latter are divine in form also." Certain rules have been laid down by Muslim scholars for testing the genuineness of the traditions about the Prophet but European scholars without exception have considered these rules inadequate. "For instance, the rules in question have almost nothing to say concerning the subject-matter of the traditions. Thus a tradition which claims the occurrence of things existing only in the wildest imagination would be accepted as genuine if all the mechanical rules concerning its transmission were conformed to, since no higher criticism would be exercised as regards its content." Still Dr. Agnides thinks that "for the most part the collections of Sunnah considered by the Muslims as canonical are genuine records of the rise and early growth of Islam." These collections, six in number, were made in the 3rd century of the Hijra, and the most important of them, the Sahih of Bukhari is revered almost as much as the Quran itself. Abu Hanifah, the chief of the Moslem legists, lived a hundred years before Bukhari, and the traditions which he used were collected by one of his students. Ijma' or the agreement of the faithful is, the third basis of law, and there has been some discussion as to whether only the agreement of professional theologian is required, or that of laymen as well. But it is about Qijas or analogy, the fourth basis, that most controversy has arisen, the school of Kufa founded by Abu Hanifah taking one side and the school of Madina founded by Malik-ibn-Anas the other. Not that Abu Hanifah was the first to use qijas but he was the first to recognise it as a general principle. "So long as the use of qijas was not given a formal recognition, but was resorted to occasionally when judgments were rendered, no controversy broke out. It was, however, a very different matter when Abu Hanifah openly declared qijas to be a legitimate basis of law and proceeded

to codify the law using *qujas* as one of his bases." Then there arose bitter opposition and the school of Abu Hanifah was accused of substituting personal opinion for revelation. The Malikite school of Madina preferred to use even a weak tradition rather than resort to analogy. But the life of Syria and Mesopotamia was so different from that of Arabia that no traditions could be found applicable to all cases and ultimately *qujas* was accepted by all schools of law. The determination of the right analogy to use gave rise to minute scholastic subtleties, somewhat resembling the subtleties of European mediæval theologians. Dr. Agnides, concludes this first part, which he claims contains much matter not previously given in any European language, with an account of the different Mohammedan schools of law.

Even in a short notice, it would not be right to omit to mention the valuable classified and annotated bibliography which follows.

The second part deals with the revenue and expenditure of Muslim states. A sharp distinction is made between Muslims and non-Muslims. The Muslims pay the *zakat* or alms, while the infidels pay the *kharaj* or land-tax and the *jizyah* or poll-tax. "The *zakat* taxes are primarily a religious obligation as between every Moslem and God, and the function of state as regards them resolves itself into one of police, namely, of seeing that the obligation is performed." Their amount is fixed by religion and cannot be increased or diminished by the ruler. Hume remarks (in 1711): "It is regarded as a fundamental maxim of the Turkish government, that the *Grand Seigneur*, though absolute master of the lives and fortunes of each individual, has no authority to impose a new tax: and every Ottoman prince, who has made such an attempt, either has been obliged to retract, or has found the fatal effects of his perseverance." There is a minimum of property, called *nisab* below which *zakat* is not payable, and this *nisab* must be free from debt. But there have been differences of opinion as to how freedom from debt is to be understood. "A person possessing 200 *dirhams*, a slave and a quantity of borrowed grain, (according to the accepted Hanifite view) pays no *zakat*, because the debt is applied to the *dirhams*. According to Zufar the debts of grain and slave are applied to the grain and slave he possesses, and a *zakat* is due on the *dirhams*." The property must have been in possession of the owner for a year before *zakat*, is due on it. "Should a person exchange his camels, on which *zakat* is to fall due at the end of the year, for other camels just a day before the completion of the year, he is not subject to *zakat* because camels are subject to *zakat* in virtue of their physical identity, but the camels received in exchange are not the very same animals and therefore are subject to *zakat* only after a year has elapsed since their acquisition." The payment of *zakat* may not be avoided after it has once been incurred, but it "may be lawfully avoided by the property owner before it has as yet become due. Thus: if a person owning two hundred *dirhams* desires to escape paying *zakat* on them, the method is to give away as alms one of the two hundred *dirhams* just one day before the year has run out in order that the *nisab* may be incomplete at the end of the year." There is a difference of opinion as to whether honey is subject to tithe. According to Abu Hanifah it is. But "Al Shafi' in his more recent view and Malik exempted honey from tithe on the analogy of silk. The

Hanifite reply is that silkworms eat leaves which are not subject to tithe, unlike the bees which collect the honey from flowers and fruits on which there is a tithe."

The *jizyah* is paid by *dhimmi*s, that is to say by unbelievers who are living in a Moslem State and are under the protection of Moslems. Its collection is based on the divine words: "Make war upon such as those to whom a Scripture has been given, as do not believe in God nor in the last day, until they pay by their hands 'the *jizyah* in order to be humiliated.'" The collection of the *jizyah* according to the general Hanifite view is as follows: "When the *jizyah* is collected from the *dhimmi* he is obliged to stand while the collector is seated, and he must wear the distinctive dress prescribed for the *dhimmi*s. During the process of payment the *dhimmi* is seized by the collar and vigorously shaken and pulled about in order to show him his degradation, and he is rebuked in these words 'O *dhimmi*, or O enemy of God, pay the *jizyah*!'" Other Hanifites recommend milder treatment but there is no doubt that the *dhimmi* must be humiliated, for this is God's own command.

The other tax paid by the infidels is the *kharaj* or land-tax. According to the Hanifites this is also paid by a Moslem who has bought land from a *dhimmi*. But Malik says that the Moslem must not pay landtax, for this involves humiliation, and a Moslem ought not to be humiliated. To this, the answer of the Hanifites is that the humiliation only arises when the tax is imposed for the first time, not when it is continued on land that was already paying it. *Kharaj* may be assessed either on the total area of the land, or on the area of the cultivated portion of the land, or on the produce. When any one of these three alternatives has been settled upon, one is not allowed to change it to another but it is continued for ever, and hence the tax may not be increased or decreased so long as the land continues the same with respect to its irrigation and advantages."

Dr. Agnides devotes a chapter to the expenditure of the *zakat* taxes. "The *zakat* may not be appropriated for impersonal purpose, such as the building of mosques, bridges, repairing of roads, draining of rivers, &c." It must be allotted to individuals and even in the Prophet's time the division often gave rise to ill-feeling. On one occasion the Prophet said, "I give to a man although another may be more pleasing to me than he is, fearing lest he should fall headlong on his face into the Fire." Afterwards God sent down "Alms are only to the poor and the needy, and those who collect them, and to those whose hearts are won, and for ransoms, and for debtors, and for the cause of God, and the wayfarer." With reference to the class called *muallafah qulubuhum* those whose hearts have been conciliated, disagreement arose after the death of the Prophet. Abu Bakr was willing to continue the presents made by the Prophet, but Umar refused. These presents, he said, were only for the time when the Muslims were weak, now that the Muslims were strong the infidels might take their choice between Islam and the sword.

In so comprehensive a work limits of space only allow us to note a few points here and there. The general character of Mohammedan finance is thus described by Dr. Agnides: "Mohammedan financial theory is an integral part of *fiqh* or Mohammedan law. Mohammedan law in turn is derived from the revealed sources of the Koran

and the Prophetic utterances and conduct, and its avowed object, as the doctors put it, is 'beatitude in the two worlds.' There is a body of revealed truth from which one must not stray, and to which one must adapt himself as best he can."

This learned work ought, we think, to form part of the library of every student of Muhammedan law. One remark in conclusion. The author says: "But for the rich collection of Oriental books of the New

York Public Library, the preparation of this dissertation in this country would have been well nigh impossible." We do not know about private libraries, but the Allahabad Public Library only contain a poor and badly catalogued collection of Arabic works. As far as books are concerned it seems to be easier to study Islam in New York than in the city of Akbar.

H. C.

A FEW WORDS ON ART AND LIFE

FOR sometime past a controversy has been raging in the Bengali monthlies about the use and purpose of art and its relation to life. This old threadbare question has now assumed such a form that it can no longer be ignored.

Some have put forth views on the mission of the poet and the relation of art to life, the trend of which is summed up in this dictum that the poet should consciously strive to be useful. They seem to forget when they so eloquently speak on the mission of the poet that the true role of the poet is not leadership: he does not intentionally show the way to any heroic time to come. He may sing of heroes: he does not create them in actual life. It is an accident that his record of their prowess is their best monument. True it is that—

...If Pindar celebrate Great

Hiero, Lord of Syracuse,

Or Theron, Chief of Acragas,

These despots wisely may refuse

Record in unending brass."

But it is true only because brass succumbs to time and stones may moulder away; while the poet's words handed down from age to age or the printed record, perpetually renewed, are more enduring. Pindar celebrated Hiero and Theron, because it pleased him to do so—not to stimulate other sovereigns to follow in their foot-steps.

The millenium need not come a day the sooner for all the poets in the world. "Art for Art's sake" may be just as meaningless a formula as the war-cry of "art for the service of society." In fact all theories of art when handled as canons and formula are apt to become meaningless. The poet does not use the things of art for an ulterior purpose. His poetry follows no ideal

of subserviency. But neither does he—as some would have it—sit aloof in the glory of his impenetrable mystery making lonely music amid the ruins of the world. The poet is no longer dishevelled, wild-eyed, half seer and half mad, pointing the road to some imagined Heaven. The detachment from all worldly things is no more true of the modern poet than of the most mundane of mortals.

One cannot even admit that Art is "for life's sake." At worst this is the masked apology of the propagandist. At best it only asserts—what is perfectly true but quite a needless truism—that Art like everything else subserves the ultimate purpose of the universe.

But to the artist Art has no extraneous purpose apart from its own expression. "Art for Art's sake," "Social Art" and "Art for Life's sake" are equally false in their isolated implications. Art is the effect, not the cause. Art is like a sunset or the flowers in the field. Like them, of course, it may produce results, but the results are incidental and variable. Lovers may kiss the sweeter for a sunset or a beautiful flower, but the sun does not set nor the flowers grow for them. Nor are the possible results of Art the reason of its being. The sea produces results. Earthquakes produce results. They do not *aim* at producing results. They are the expressions of the earth in the travail of its being. No poet, if he was a real poet, ever wrote in order to produce any effect whatever upon any one at all, not even his lady-love. Art is an inevitable product of a certain set of circumstances; it is one of the flowers of life—perhaps the finest.

The only conceivable purpose of exist-

once demands that every unit should come to its full self-realisation. No potential value must be lost. The claim of every individuality should be asserted. Every one of us strives unflinchingly to be himself. The poet too like any of us seeks to become himself. But there is more. Every intense individuality will express itself. It will seek to realise its approach to selfhood, its "becoming"—internally and externally as well. The artist's expression is Art. No individuality can escape this law. If there is no attempt at external expression, there is an inward refusal to be oneself—a shrinking from life. Poetry is the outward revelation of the poet's will to find himself. It is the effect of the causes that go to make up the potentiality of the poet : of circumstances in their widest sense, of the epoch in which he lives and by which he is, to some extent, conditioned : of the inherited past of the particular art in which he seeks expression ; but far more intimately of the obscure and undecipherable impulses that constitute his personality in its wildest and deepest sense.

To check or attempt to control this expression of the poet, by imposing upon him from outside any formula or theory on Art or Life, is to set back his inward self-expression and thus commit spiritual murder. The advocates of "Art with a purpose" should not forget that the personality of a man seeking self-realisation and expression is deeper than politics or nationality or religion. It is absurd to demand of a poet that he defend and identify himself with a cause, political, national or

religious, or that he even express it. Poet Nabin Sen's expression of himself is profoundly coloured by Hindu ideas and ideals. But he did not set out to glorify the "sacred tuft of hair" or versify the tracts of the Anti-cow-killing Society. His expression of himself is more than Hindu. I will even go so far as to say that his Hinduism is partly accidental, the result of external circumstances. But there is something deeper and more personal in his Art. There is himself. Some of his sincerest admirers are not Hindus at all. It cannot be his Hinduism which attracts them.

The critic should not also ask if a poet's expression, his poetry, is in accord or not with the accepted conventions of the world. For these are made by those and only those who have refused to live ! Indeed the more the poet's work is in disaccord with these, the newer and more valuable in the sum total of spiritual evolution will be the personality of which it is the outward expression. The duty of the critic is to disengage from the poet's work the part of the poet's surroundings, the part of his historical place in his art, and, beyond and above these, the part of the man expressing himself. The poet, then, expresses himself because he must. He creates beauty, quite independently of all formulas on Art, and says to the world if he says anything : "Take it or leave it." And the world mostly leaves it, afraid for "the little house of cards it calls Society, the refuge of the Eternal No."

AMAL CHANDRA HOME.

TAGORE IN JAPAN

I WAS pleased to hear in London two years ago that Sir Rabindranath Tagore, alarmed by the violent temper of the European nations running counter to all the finer instincts of humanity so cherished by him, hurried to return to a region in India where, to use Sir Rabindranath's words, his great ancient civilisation had its birth. As I already expressed somewhere, I returned home from London, let

me say again, much dissatisfied with the Western life founded on individualism and often egoism or self-satisfaction ; in fact, I returned to Japan, whose spiritual safety should require her to refuse the Western invasion with its long arms reaching out after exciting luxury or disruptive sensation. I said that the social community of the West was less harmonious and loving ; and when one does not respect the others,

I said, there will be only one thing to come, that is strife, in action or in silence. And my prophecy has been, I dare say, amply fulfilled by the present European war. (Pray, let me speak as if we were not concerned in the war as one of the belligerents.) I feel justified on reading Ernest Rhys' study of Rabindranath Tagore to find in the earlier part of the book such a phrase: "The major energies of the Western world, as Sir Rabindranath observed them, were not constructive; they did not make for the world's commonwealth, and by their nature they must come into conflict sooner or later." He was evidently in the same thought with myself: As I said at the beginning, I was pleased that our Indian poet returned from Europe to a region in India, to use his words, "where the mind is without fear and the head held high, where the world has not been broken up into fragments by narrow walls, where the mind is led forward into ever-widening thought and action."

My first thought, or more true to say, my uneasiness of mind, on having right before us the Indian poet whose melodious strength, as the *Athenaeum* once observed, might recall familiar passages in the Psalms or Solomon's Song, is certainly that our modern Japan with her wholesale adoption of the so-called Western civilization which is turned perhaps to use and then left aside, quite forgetting at least in our cities the old meditation and service for attainment of the ideal of perfection, would reveal herself to Sir Rabindranath as London or Paris to be an ugly monster restless and tending to trouble, from which he might run away in haste. He confesses his first impression of Japan seen from the balcony of a house at Kobe in the following language:

"The town of Kobe, that huge mass of corrugated iron roofs, appeared to me like a dragon, with glistening scales, basking in the sun, after having devoured a large slice of the living flesh of the earth. This dragon did not belong to the mythology of the past, but of the present; and with its iron mask it tried to look real to the children of this age,—real as the majestic rock on the shore, as the epic rhythm of the sea waves. Anyhow it hid Japan from my view, and I felt myself like the traveller, whose time is short, waiting for the cloud to be lifted to have a sight of the eternal snow on the Himalayan summit."

As I expected, his two lectures, gracefully elaborated in phraseology, which he delivered before the students under the

titles of the "Message of India to Japan," and the "Spirit of Japan," with an impressively vibrant voice and an eloquence, emphasised by something foreign, which, as Rhys remarked somewhere, turned a brick-made hall into a place where the sensation, the hubbub and the actuality of the modern world were put under a spell, were in fact a strong reminder to us of the threatening dangers in our surrender, to use his words, before the screeching machinery and gigantic selfishness, the blatant lies of statecraft and the smug self-satisfaction of the prosperous hypocrisy of the West. When he laughed and sneered at the so-called Modernism ("True modernism is independence of thought and action," he declared, "not tutelage under European schoolmasters"), he doubted and even slighted the Western science which forgot that man's existence is not merely of the surface, and as he declared offhand, looked so powerful because of its superficiality, like a hippopotamus that is very little else but physical; and when he declared the spirit of the Western civilization to be poisoning the very fountainhead of humanity, and advocated that Japan should have a firm faith in the moral law of existence clear of the path of suicide of the Western nations, and spoke of the common spiritual heritage of the "whole of Eastern Asia from Burma to Japan," the large audience who were listening to him distinctly divided into two opinions; while some, adherents of the so-called Western civilization in Japan, called Sir Rabindranath merely a propagandist of negativism or willful dreamer who, in spite of himself, will surely fail to realise the fulness of his own nature, the others, delightfully awakened into the so-called Japanism or Orientalism endorsed by the exposed weakness of the present European war, thought that Sir Rabindranath agreed with their first principle in encouraging the real individualism to assert the inner development of the nation. The Japanese chauvinists (I admit that we have a great number of them here) were pleased to hear the Indian poet saying that the political civilization which had sprung up from the soil of Europe and was overrunning the whole world like some prolific weed, was based upon exclusiveness; he declared: "This spirit of extermination is showing its fangs in another manner—in California, in Cana-

da, in Australia,—by inhospitably shutting out aliens through those who themselves were aliens in the land they now occupy." What Sir Rabindranath brought to the well-balanced intellectual Japanese minds was this : How can we properly check the Western invasion ? Again how can we keep our own beauty and strength grown from the soil a thousand years old and let them realize the fullness of their nature, not curtailing all that is best and true in them at the threatened encroachment of foreign elements ? After all, he only presents this great momentous question ; and like any other prophet, he does not answer the question, only pointing the way by his inspired hand unseen but sure ; it is our work to solve it.

Again I am glad to have him in Japan from a literary point of view ; his presence before us, as his presence in London encouraged many English poets who were in doubt how to return to an age like Chaucer's England, when there was only one mind, as Yeats remarked, and poetry was something which had never seemed strange, unnatural, or in need of defence, is in the highest sense meaningful, if as in fact our present Japanese literature is sauntering away from the spiritual wholeness of a symphony, becoming some individualistic scraps which only rebel against the soul's surrender to a divine instinct or real naturalness. I myself as a fellow-worker in the literary domain feel a great joy in reading his songs, again to use Yeats' words, "so abundant, so spontaneous, so daring in passion, so full of surprise," because first of all he teaches or hints to us, how to "rebuild our literature through the force of music whose heart is simplicity." I addressed to him one poem, part of which runs as follows :

"Oh, to have thy song without art's rebellion,
- To see thy life gaining a simple force that is itself
creation.
Oh, to be forgotten by the tyranny of intellect ;
Thou biddest the minuet, chausen and fancies to
be stopped,
"The revels and masquerade to be closed ;
Thou stoopest down from a high throne
To sit by people in simple garb and speech.

In simplicity
Thou hast thine own emancipation ;
Let us be sure of our true selves,
There is no imagination where is no reality ;
To see life plain
Is a discovery or sensation.

Although he was pessimistic over the general aspect of Japan at the outset seeing quite a dominating westernization which is threatening Japanese civilisation, it seems that he soon found a Japan more true and more human, as he had hoped to find ; he says in one of his lectures :

While travelling in a railway train I met, at a wayside station, some Buddhist priests and devotees. They brought their baskets of fruits to me and held their lighted incense before my face, wishing to pay homage to a man who had come from the land of Buddha. The distinguished serenity of their bearing, the simplicity of their devoutness, seemed to fill the atmosphere of the busy railway station with a golden light of peace. Their language of silence drowned the noisy effusion of the newspapers. I felt that I saw something which was at the root of Japan's greatness.

Again he says :

Japan does not boast of her mastery of nature, but to her she brings, with infinite care and joy, her offering of love. Her relationship with the world is the deerer relationship of heart....Your national unit is not an outcome of the necessity of organisation for some ulterior purpose, but is an extension of the family and the obligations of the heart in a wide field of space and time. The ideal of "Maitri" is at the bottom of your culture,—"maitri" with men and "maitri" with nature. And the true expression of this love is in the language of beauty, which is so abundantly universal in this land.

I can assure Sir Rabindranath or anybody else that we are still sufficiently Japanese as in the olden time, whose hearts will at once respond to the joy and song of foliage and waters ; we daresay that we are quite ready to sing, as Sir Rabindranath sang once in "Gitanjali" :

"I am here to sing the songs. In this hall of thine I have a corner seat.

In thy world I have no work to do ! my useless life can only break out in tunes without a purpose.

When the hour strikes for thy silent worship at the dark temple of midnight, command me, my master, to stand before thee to sing.

When in the morning air the golden harp is tuned, honour me, commanding my presence."

YONE NOGUCHI.

INDIAN PERIODICALS.

The Triumph of Individualism

is the theme of an illuminating article appearing in the *Arya* for September. The conquest of individualism over conventionalism has been set forth in a masterly way in the article under review.

We read :

The individualism of the new age is an attempt to get back from conventionalism of belief and practice to some solid bed-rock, no matter what, of real and tangible Truth. And it is necessarily individualistic because all the old general standards have become bankrupt and can no longer give any inner help; it is therefore the individual who has to become a discoverer, a pioneer, and to search out by his individual reason, intuition, idealism, desire, claim upon life or whatever other light he finds in himself the true law of the world and of his own being. By that when he has found or thinks he has found it, he will strive to rebase on a firm foundation and remould in a more vital, even if a poorer form, religion, society, ethics, political institutions, his relations with his fellows, his strivings for his own perfection and his labour for mankind.

It is in Europe that the age of individualism has taken birth and exercised its full sway; the East has entered into it only by contact and influence, not from an original impulse.

And it is to its passion for the discovery of the actual truth of things and for the governing of human life by whatever law of the truth it has found that the West owes its centuries of strength, vigour, light, progress, irresistible expansion. Equally, it is due not to any original falsehood in the ideals on which its life was founded, but to the loss of the living sense of the Truth it once held and its long contended slumber in the cramping bonds of a mechanical conventionalism that the East has found itself helpless in the hour of its awakening, a giant empty of strength, inert masses of men who had forgotten how to deal with facts and forces because they had learned only how to live in a world of stereotyped habitudes of thought and customs of action. Yet the truths which Europe has found by its individualistic age were only the first obvious, physical facts of life such as the habit of analytical reason and the pursuit of practical utility can give to man. If its rationalistic civilisation has swept so triumphantly over the world, it is because it found no deeper and more powerful truth to confront it; for all the rest of mankind was still in the inactivity of the last dark hours of their conventional age.

The dawn of individualism is always a questioning, a denial. The individual finds a religion imposed upon him which does not base its dogma and practice upon a living sense of ever verifiable spiritual Truth but on the letter of an ancient book, the infallible dictum of a Pope, the tradition of a Church, the learned casuistry of schoolmen and Pundits, conclaves of ecclesiastics, heads of monastic orders, doctors of all sorts, all of them unquestionable

tribunals whose sole function is to judge and pronounce but none of whom seems to think it necessary or even allowable to search, test, prove, inquire. He finds that, as is inevitable under such a regime, true science and knowledge are either banned, punished and persecuted or else rendered obsolete by the habit of blind reliance on fixed authorities; even what is true in old authorities is no longer of any value because its words are learnedly or ignorantly repeated but its real sense is no longer lived except at most by a few. In politics he finds everywhere divine rights, established privileges, sanctified tyrannies which are evidently armed with an oppressive power and justify themselves by long prescription, but seem to have no real claim or title to exist. In the social order he finds an equally stereotyped reign of convention, fixed disabilities, fixed privileges, the self-regarding arrogance of the high, the blind prostration of the low, while the old functions which might have justified at one time such a distribution of status are either not performed at all or badly performed without any sense of obligation and merely as part of the caste pride. He has to rise in revolt; on every claim of authority he has to turn the eye of a resolute inquisition and when he is told that this is the sacred truth of things or the command of God or the immemorial order of human life, he has to reply, "But is it really so? How shall I know that this is the truth of things and not superstition and falsehood? When did God command it and how do I know that this was the sense of His command and not your error or invention or that the book on which you found yourself is His word at all or that He has ever spoken His will to mankind? This immemorial order of which you speak, is it really a law of Nature or an imperfect result of Time and at present a most false convention? And of all you say, still I must ask, does it agree with the facts of the world, with my sense of right, with my judgment of truth, with my experience of reality?" And if it does not, the revolting individual flings off the yoke, declares the truth as he sees it and in doing so strikes inevitably at the root of the religious, the social, the political, momentarily perhaps even the moral order of the community as it stands, because it stands upon the authority he discredits and the convention he destroys and not upon a living truth which can be successfully opposed to his own. The champions of the old order may be right when they seek to suppress him as a destructive agency perilous to social security, political order or religious tradition; but he stands there and can no other, because to destroy is his mission, to destroy falsehood and lay bare a new foundation of truth.

We thoroughly agree with the views so powerfully expressed in the following concluding portion of the article :

It is no longer possible that we should accept as an ideal any arrangement by which certain classes of society should arrogate development and full social fruition to themselves while assigning service

alone to others. It is now fixed that social development and well-being mean the development and well-being of all the individuals in the society and not merely a flourishing of the community in the mass which resolves itself really into the splendour and power of one or two classes. The individual is not merely a social unit, nor does his existence, right and claim to live and grow found itself on his social work and function, that he is not merely a member of a human pack, hive or ant-hill, but something in himself, a soul, a being, who has to fulfil his own individual truth and law as well as his natural or his assigned part in the truth and law of the collectivity. He demands freedom, space, initiative for his soul, for his nature, for that puissant and tremendous thing which society so much distrusts and has laboured in the past either to suppress altogether or to relegate to the purely spiritual field, an individual thought, will and conscience.

Bawa Budh Singh contributes an interesting article on

Punjabi Ballads and Songs

to the *Sikh Review* for August.

The writer tells us that the modern style and idiom are wanting in the old ballads. To the modern ear the diction may be rough and sometimes vulgar, but the *Idea* and the *Emotion* are there. And these really constitute the bulwark of poetry.

In Panjab, the old ballads have never been reduced to writing. The chief reason being that the local dialect never received the state support. At present the Hindus and Mohammedans are alienating their sympathy from their mother-tongue. Under such circumstances how can we expect the hidden treasures of a language to find their due place in the museum of the world literature? The Panjabi songs or ballads are as a rule mostly true songs—exhortations from a female to her lover or husband. We seldom come across any old ballad, or a love song in the form of an exhortation from a man to his lady love. This is the strain in which Panjabi songs are written and this style is somewhat general in India and rather in the east. The prevalence of this style is not to be misconstrued as showing that women of Panjab or the east are more fashionable and desperate lovers than their western sisters.

The Panjabi songs can be divided into two chief parts—(1) short ballads, (2) songs. The former generally consist of two or more lines and are in the form of exhortations or emotional outbursts of female hearts. They are generally sung in chorus to the accompaniment of some crude musical instrument, generally "Dholak" (a drum). Men have their own ballads which they sing on the occasion of fairs like Baisakhi, but these are mostly vulgar and have not much of beauty about them, although they depict the Jat mind in simple and forcible language. The lengthy songs are generally narrative, they narrate certain stories of incidents of love. Some of these songs are in the form of a dialogue, and occasionally more than two persons are introduced in the conversation. Most of the ballads are sung in adoration of "Ranjha," the idol of love and an ideal sweetheart

in the Panjab. Hir adores her cowherd lover in various forms. This love story attained so great a reputation in the Panjab that Saints and Fakirs also gave it a place in their compositions.

The songs are generally tuned to music but not properly versified. Some are written in blank verse, while others are with proper rhymes.

It is again difficult to define with certainty the authorship of such ballads. Some seem to have been composed by women while in others where metre and diction is regular the man's artful hand is clearly visible.

The language of the songs is Panjabi, but the Western Panjabi predominates. It is the Western Panjabi which is rich in ballads. All Panjabi romance sticks to the Chenab the eastern boundary of Western Panjab, its proximity to Lahore the Capital of Panjab naturally brought the romantic spirit of the song to the central Panjab, but the Eastern Panjab remained barren in this respect. We cannot find any Panjabi Poet of repute in the eastern Panjab. The language of the songs has traces of old Panjabi words now obsolete.

These songs beautifully depict the customs and the trend of human mind in those old times. They are grand in their simplicity, whether the song is a love ballad or a marriage ditty.

Here are some marriage songs :

At a boy's marriage a popular "Ghori" song is in the form of an exhortation from a sister :—

Oh my brother, thy sister has spun this very fine thread for thy turban which enhances thy beauty and thy father got it very carefully woven. Thy sister, Oh my brother, is ready to take over herself all thy misfortunes, thou mayst live for ages, and go to thy father-in-law's house with all glory.

The son of a weaver, friend of my beloved brother, whom he loves much, has brought these "Jora and Chuni," coat and a wrapper. Wear them, oh my brother, wear them.

My dear Mal or Nanda, thou lookst like the full moon, with a red mark "Filak" on thy forehead, with an umbrella over thy head, and a betel leaf in thy mouth; wear them oh my brother, thou wear them and I pay the price.

When nuptials of a daughter are to be celebrated the females sing :—

Oh daughter, why wert thou standing behind the sandal tree?

I was standing near my papa saying—"Papa speak, thy daughter has become of marriageable age and needs a consort."

Oh daughter, what sort of husband thou desirest? Oh papa (I want a husband who may be) like a moon amongst the stars, and a Krishna amongst the moons (handsome persons), I want a Kanhaiya-like husband.

The above song has succinctly put forth the emotions of a girl's heart. Krishna is still the ideal of love amongst Hindu women.

Another popular song "Sohag" is :—

A daughter implores her father :—Papa, send me into that house where masons build palaces.

Papa, it will be your great gift and charity, and great will be your praises. (The house may have) eight rooms and nine windows, and into each window I will put my heart. Papa marry me into that family, where Jats milk the she-buffaloes. I may keep milk of one to be turned into curd and churn that of the other that my hands be full of butter. Papa do so, it will be your great gift and charity to me and it will enhance your praises.

Papa send me into that family, where my mother-in-law has got good many sons, one may be betrothed, and another married and so on, and I may witness happy ceremonies frequently. Papa marry me into that family where the mother-in-law is a kind and prominent figure and the father-in-law be a chief. I may sit on a low lady's chair in front of my mother-in-law and she would never show a wrinkle on her forehead (be always pleased) and so on.

The following love songs though simple are yet appealing :

"The handsome lover has white teeth and black eye brows and his features are beautiful beyond description. Oh wearer of a turban, do not go turning your back towards me, I am looking at thee at every step. Oh save me. The offended lover does not turn round and listen to my bewailings. I sit on a low chair, and wash the clothes with tears which flow like rain from my eyes. I have spent myself up in pacifying him—but the displeased lover does not heed my entreaties."

The following song is put in the mouth of "Sohni" while she was being drowned in the Chenub in her wild attempt to see her sweetheart Maliwal :—

"Oh care-taker of the shu-bulaloes, Oh love intoxicated Fakir, thy Sohni is dying by drowning. On the yonder bank stands my sweetheart and lover, while I am being drowned by the waves. If this life is gone, let it be sacrificed over my lover, but let my love with him remain untarnished, if God is not pleased to allow my raft "Kachcha Ghara" (unburnt pitcher) to reach the bank of safety where my lover stands.

In another song Sohni is made to say :—

Oh fish and turtles of the water, eat and eat you may all my flesh, but pray, do not touch the eyes as I have still left the longing to see my lover.

Take to thy wings oh black starling and take a long long flight. Go and tell my husband—"Thou hast forgotten thy bride and cheated her." Is it oh my husband, that I have become old or that thou hast forgotten me ?

No ! My Beauty, thou hast neither become old nor I have forgotten thee.

Quite so ! (then) why hast thou neither sent any letter nor any word about thy welfare ?

My darling, to what messenger could I entrust my letters or word about welfare ?

Is it that thou hast got no paper to write upon and no reed to make your pen ?

If I were thee I would make the piece of my heart a writing paper and cut my fingers into pen. The black powder of my eyes moistened with my tears would form the adequate ink.

Fingers covered with rings, the little finger coloured yellow.

My offended sweetheart will not make peace, though I have employed a mediator.

Though forbidden, he will not listen, the stupid will not obey.

If our houses are side by side, and our fields adjoin each other ;

If my sweetheart's house be close by, I shall be able to live on having talk with him.

Though forbidden, he will not listen, the stupid will not listen.

With wildness in his eyes, he puts a low lady's chair (Pihra) down and sits besides me.

Though forbidden, he will not listen.

Female Education in India.

Some of the crying problems of female education in India have very well been presented in the following editorial notes appearing in a recent number of the *Indian Education*.

The eternal problem of female education is to find teachers. The Anglo-Indian communities of India have their full share of it. No sooner does an intelligent, attractive girl drift into the teaching profession than she is caught up by the claws of predestination and married. The Hindu community, with its surplus widows, might seem to a foreigner to be exceptionally well-placed for female education, but *a priori* reasoning as usual would be misleading. There is no profession in India where the widow is more impossible than in teaching. What is to be done ? Sometimes we have doubts about the education of women in schools at all.

One thing is certain, that extended female education, like other good things, will have to be paid for. The payment will come in the shape of added discomfort of life. The first effect of education is to give people a distaste for work and a taste for intellectual and other luxuries—the cinematograph, etc. This presses heavily on a small income, such as most of the candidates for education enjoy. And education has no tendency, at least no direct tendency, to increase the productivity of labour—there is not more to divide than there was before. Result—discomfort and discontent. We do not say the price is too heavy for the intellectual elevation, but it will have to be paid, and it will be heavier for the education of women than of men.

By the way there is much to be said for the San Francisco way of settling the female-teacher problem—as explained to us in San Francisco. They do not aim at having a permanent set of female teachers—middle-aged females get stale, they say. They look forward to a continuous stream of bright young girls flowing through their schools. They don't give them much training—just whack them into shape a little by a few practical lessons ; no pedagogics, no psychology. Then they launch them in the schools : their temperament carries them on. They find inducement for the career in the effect on their own characters of a little teaching experience, it gives them firmness, qualifies them to manage their husbands and their own children. The American man prefers a certain firmness in woman, so all is well. And the children learn their rudiments as well as they do under the more complicated systems. But, like other institutions, this might not bear transplanting.

Religion, Politics and Collective Life

is the theme of a sober and well-written article contributed to the *East and West* for October by G. C. Whitworth.

"Some writers in the *Prabuddha Bharata*" says the writer, "have been arguing that Indian political leaders make a great mistake in seeking to found an Indian nationality upon political principles." So

Every Indian—Hindu, Musalman or Christian—

is asked to rally round the spiritual ideal, without in any sense giving up his particular creed; and to steer clear of the Scylla of narrow orthodoxy as well as of the Charybdis of Western prepossessions; eschewing indeed all bigotry and recognising that the same God is worshipped by all; and looking forward to the harmonious development of all creeds and faiths already existing or yet to exist.

The writer very ably points out some fundamental errors involved in the views put forward.

In the first place, the conception of politics is entirely erroneous. It was a German who said "War is not the sequel, it is the failure of politics. The sequel of politics is art, science, religion—all that goes to make what Aristotle called the good life—for the full development of which the State is the essential condition."

If we regard politics as a "game," as furnishing a field for personal distinction, for the exercise of power, for a career; if we associate with the term such factors as party spirit, greed of place, sacrifice of principle, abandonment of conviction, jealousy, corruption, bribery, rowdy elections, snap divisions, and so on, it is to be remembered that these things are not true politics, but an abuse of politics.

And if politics must be rejected as a foundation for nationality because of the liability to abuse, what are we to say of religion in the same capacity? Is it not equally liable to abuse?

The right view of politics is thus set forth by Mr. Whitworth:

Politics rightly regarded may be said to consist primarily of thought and action for the benefit of others. As soon as a man's sympathy and consequent action extend beyond his own wants and those of his family, he enters upon politics. Nor is his part in politics valuable only for what he can do for others. It is necessary also for his own social development. Or, as Mill puts it, his individual energy of mind and character must be developed all round and in all things and can only be so developed if the area of individual thought and will be extended to embrace the affairs of the whole community.

The writer goes on to say:

These advocates of nationality founded on religion when they tell us that the most fundamental task in the practice of religion is to detach the mind from all domestic relations and sense-enjoyments, when they extol asceticism, and say that renunciation is essential to spiritual realisation, forget that religion transcends intellect, and that a religion within the limits of intellect and sentiment is no religion at all, that the same moral rules cannot be preached to *sadhus* and to householders and that the highest *advaitism* cannot be brought down to practical life. Clearly nationalism cannot be founded on religion as thus conceived. It is a religion for the few, not for the many. A nation must consist of householders, not of *sadhus*: a nation of hermits is a contradiction in terms.

These writers fail to perceive that in relation to nationality the two things, religion and politics, meet together and become in effect one. The difference between them is that in the case of religion a more concrete divine sanction is appealed to, while in the case of politics what is really the same sanction is rather assumed than formally expressed. But the

mischievous result of the attitude taken is that politics, instead of being cheerfully welcomed as a part of religion, is grudgingly admitted as a thing evil in itself though unfortunately necessary. Politics, it is admitted, has its subordinate function, but its connection with religion is not recognised. And then we are told absolutely that religion is not only the great redeemer of all mankind from *avidya* and its endless miseries, but specially in India it is also the great nation-builder; and these two aspects of religion, the writers say, they seek to present before their countrymen. But politics being excluded, there are not two aspects of religion, but only one aspect. And religion under that aspect, if indeed it can redeem all mankind, certainly cannot build a nation.

Spirituality is a term of high association both in the East and the West, while worldliness is usually a term of evil association. But both terms are liable to be misused, and it would be no offence to language to speak of a spiritual worldliness. Let us not be too quick to condemn the world. After all, we have been placed in it by what we conceive to be a beneficent power, and we know that the world is what it is partly through our material, but still more through our spiritual energy.

Elements of collective life are but vaguely dealt with by the writers of the *Prabuddha Bharata*. We read:

Education is to be imbued with the national ideal and is not to be narrowly denominational. Poverty and insanitation are to be met by bringing organised intelligence and activity into the villages, and this is to be effected apparently by getting the middle classes to return to the villages which they are said to have deserted.

Under these heads it is only the vagueness of the proposals to which exception can be taken—the ideals seem to be sound and elevated.

In the present crisis of disorganisation, we are told, the remedy is to reinstate that scale of social values which embodied itself in past social distinctions, and then to invite the low to emulate the high along the real line of social worthiness.

This is pitiful.

The article under review is concluded with the following pertinent observations:

There is a special reason why India should be distrustful of her past. There are few questions affecting human society which are not open to argument—something can usually be urged in support of even the worst causes. Still there are a few questions which are really past all reasonable argument, and two of these at once spring to mind upon the mention of the two words "untouchable" and "infanticide." The first of these questions is well before the public at the present time and needs no discussion here. As to the second, I do not for a moment aver that infanticide is a common crime in India, but the word with its associations serves, as no other single word can, to bring to mind that preference for male over female offspring which is still a strong sentiment in India. As providence has not endowed parents with the faculty of the choice of sex, it ought ordinarily to be a matter of equal joy whether a son or a daughter is born to them. We know that that is very far from being the case in India.

The Waste of Infant Life in India

is the title of a melancholy article appearing in the October number of the *Social Service Quarterly* which is a review of the annual reports of the sanitary commissioners of Bombay, Madras, Central Provinces, United Provinces, Assam and Burma for the year 1914.

The writer correctly begins by saying that

The Annual Report of the Sanitary Commissioner on the sanitary administration of a province and the health of its inhabitants would be one of the most valuable of public documents, if, besides the various statements of figures in the prescribed form and the description of the routine of administration, the Sanitary Commissioner presented, in an attractive and popular style, the general conclusions to be drawn from the facts and figures marshalled in the Report and the remedies suggested. This general inadequacy is most clearly brought home when one considers the manner in which the subject of infant mortality is treated in these Reports.

The following statistics clearly show the appalling infant mortality in the country :

In Bombay, the rate of mortality of infants calculated on the number of registered births was 198.81 per 1,000 in 1914, against 188.42 in the previous year. As many as 2,61,302 deaths were recorded among children under 5 years of age, giving a rate of 95.51 per mille. Among the measures adopted in Bombay for reducing infant mortality, are the giving to a number of poor women, during confinement, relief in the shape of necessaries and comforts such as milk, loaves, blanket, and charpais. A few municipal nurses and midwives are also engaged and they have to move about in localities entrusted to them and find out prospective mothers. They have then to attend on confinements among the poor and continue their visits even after the lying-in period and give advice on the care and feeding of infants. The advantages of these measures, which are in the experimental stage, however, barely reach the bulk of poor women in Bombay. In the Madras Presidency, the infantile death-rate was 196.5, the incidence of the deaths of infants being the heaviest in the city of Madras where the rate was 312.5. It appears from figures for preceding years that this incidence shows a marked tendency to rise ; and as to preventive measures, they seem to be non-existent, for the Sanitary Commissioner finds it necessary to suggest that the Health Department of the Madras Corporation should see to this and try to discover causes with a view to adopting necessary remedies. In the United Provinces, the death-rate of infants was 233.5 as against a decennial average of 255. The chief preventive measure adopted in these provinces was an increase in the number of travelling dispensaries from 74 to 87. 793 *dais* were admitted for training in the essentials of midwifery and the care of children. In a few districts, leaflets on the feeding of young children were distributed.

The mortality among children under five years formed 60 per cent. of the total deaths in the Central Provinces. The rate of infant mortality was 263.89. The Sanitary Commissioner remarks that in many

towns a definite advance has been made by employing a municipal midwife or female sub-assistant surgeon. The Sanitary Commissioner also refers to the efforts made in Nagpur to secure a reduction of the mortality. The lady doctor of the city obtains information of as many labour cases as possible from the *dais* in attendance, and offers skilled assistance where needed. Her experience is that, although trained assistance is available, the employment of the *dai* is such a time-honoured custom that her services are preferred to those of another agency by the vast majority of people.

The rate of infantile mortality in Burma was 216.36. A marked increase was observed in nipe towns, but the Report states that for none of the towns was any satisfactory explanation received from the health officers. In some cases, the increase was overlooked and not considered fit for comment. Other frequent explanations were the prevalence of "child's diseases" or convulsions or malaria. The Sanitary Commissioner is therefore justified in remarking that the study of the causes of infantile mortality in the Province is still in its infancy. The only information vouchsafed in the Assam Report is that, as in the previous years, the death rate was highest among infants under one year.

We thoroughly agree with the writer when he says in conclusion :

• Here it will not be improper to comment on the more or less perfunctory manner in which the question has been treated in the Reports. The causes of the high mortality among infants may be as open to dispute as the means of its prevention. But that is no reason why the question should be dealt with in any but a thorough manner. It is apparent from the Reports that there is a diversity of views about the causes, but this is mainly due to the absence of systematic inquiry. The poverty, and not seldom the immaturity, of the parents, their ignorance of the proper ways of rearing children, and the insanitary surroundings in which the poor have to live necessarily make the life of infants very precarious. Under conditions like these—to which most mothers and children are exposed,—the surprising thing is not that so many infants die, but that more do not die.

A fuller knowledge of these and other causes will suggest remedies. As it is, the Reports do contain a record of measures adopted to remove the evil. But these measures are at best isolated and inadequate. Organized efforts are necessary and there is a heavy responsibility on all interested—parents, doctors, sanitary authorities, and the general public. The commencement of the campaign must be anti-natal. The care of the expectant mother takes the foremost place among the remedies. This presupposes in all who are concerned in the care of pregnant women the necessary knowledge of their proper treatment. We have yet to educate the masses of people in the best means of saving and preserving infant life, to open their eyes to the great extent of infant mortality, and to impress upon them the facts that the prevailing excessive mortality is a national disaster and that much of this waste of life can be, and ought to be, prevented. In this country, where the bulk of population is illiterate, it may be difficult to achieve much by trying to educate the mass of people through the Press or by lectures, but personal influence can be effective, and this work of promoting the health of mothers and the welfare of infants and children offers an ample field for the energies of those women who have received the benefit of higher

education. In addition to an educational propaganda and systematic house-to-house visiting, there is an urgent need for the provision of beds, wards, even hospitals, set apart for maternity cases, at least, in all towns. For, any suggestion like this about villages, most of which have to do without even a dispensary, would be premature. Hospital accommodation for pre-maternal cases may also be arranged for, but only in places where due provision has been made for the treatment of maternity cases. In brief, if from the commencement of pregnancy, healthy conditions of life could be made possible for mother and child, and proper attention could be secured for the feeding, clothing, and up-bringing of the infant throughout the first year of life, a large number of the lives of infants now lost from tetanus, debility at birth, acute lung diseases, and malnutrition might well be saved.

The Conservation of Life.

James Mathers contributes to the *Young Men of India* a thoughtful article under the above heading in which he tries to discuss the true meaning of life.

Man tries to interpret life according to his own temperament. Thus the materialist attempts to find life's secret in matter. The saint seeks its source and end in God. The ordinary man is content with vague and cloudy notions.

Much of the backwardness of India in things economic and material is due to the philosophic view of life which obtains in our country.

In the philosophic view, life is a dream, and true life only comes in the awakening from the dream. The world is a delusion, essentially an evil thing, and stands in the way of the true development of the soul. It is, therefore, something to be got rid of at all cost. Asceticism, seclusion from the world, forest life, meditation, and yogic practices are what this theory of life leads to. In ancient times in India an earnest attempt to conserve life in this way was made by not a few of her most gifted sons, and the Buddhist ideal of life follows the same path. Some aspects of Christian religious mysticism are also based on this ideal, especially certain ascetic types developed in mediæval times. But it is in India alone that the attempt has had a profound influence on the general life of her people. It has led to an almost universal lessening of the sense of the worth of the world and the world's work; and although many endeavours have been made mitigating the rigour of the theory in the interests of social and material progress—by such mediating philosophies as are embodied in the *Bhagavat Gita* and the commentaries of Ramanuja—still the effect is present in the whole general attitude of the people of India to the active side of life, and in the fatalistic acquiescence in events, which ever says, "What happens, happens." In a recent speech to the Mysore Economic Conference, the Dewan of Mysore traced to this fatalistic tendency of the race much of the difficulty that stands in the way of India's economic progress. How this is so may be gleaned from the words of a Spanish poet :—

Man dreams what he is, and wakes
Only when upon him breaks
Death's mysterious morning beam.
The King dreams he is a King
And in this delusive way
Lives and rules with sovereign sway :
All the cheers that round him ring,
Born of air on air take wing ;
And in ashes—mournful fate—
Death dissolves his pride and state.
Who would wish a crown to take,
Seeing that he must awake
In the dream beyond death's gate !
And the rich man dreams of gold
Gilding cares it scarce conceals ;
And the poor man dreams he feels
Want, and misery, and cold.
Dreams he too who rank would hold,
Dreams who bears toil's rough rubbed hands.
Dreams who wrong for wrong demands.
And in fine, throughout the earth
All men dream, whate'er their birth,
And yet none understands.
'Tis a dream that I in sadness
Here am bound, the scorn of Fate :
'Twas a dream that once a state
I enjoyed of light and gladness.
What is life ! 'Tis but a madness.
What is life ? A thing that seems,
A mirage, that falsely gleams,
Phantom joy, delusive rest.
Since is life a dream at best,
And even dreams themselves are dreams.

Such thinking in a people can but lead to a desire for death in the sense of a cessation of conscious existence and the extinction of personal individuality ; or, failing the hope of this, to a listless hopeless acquiescence in things as they are. And this latter is what in the main has actually happened in India. The chosen few may elect to tread the higher way to union with God, but the many are doomed to a seemingly endless whirl of cycles of existences, theoretical dreams, but very real and very hopeless to those imprisoned in them. India's pessimistic outlook on life and quietism have been the result. We need not stay to criticise this theory of life. The whole trend of modern thought condemns it, and the whole spirit of national feeling, and desire for economic and individual progress, that are so prevalent in India at the present time, are utterly contradictory to it.

The writer goes on to say :

To-day in the sciences dealing with mental and psychological processes, and in the science of religions, we are extending the boundaries of science as a whole, and in consequence revising many of the dictums of the natural scientists of last century. Then the tendency of science was to assert that there is no life after death. Death is the end of all things to the individual. The natural lesson from such a doctrine would be, "Eat, drink, and be merry, for death is the end of all." More, perhaps, than we realize, this philosophy of life has affected our Western political, social, and commercial idea. National self assertiveness, social emphasis upon position and power, and the commercial instinct that would ever buy in the cheapest market and sell in the dearest, oblivious of all other interests, rest ultimately on a latent belief in the supreme worth of this present life. But to adopt this attitude to life is to reduce human life to the level of the beasts that perish. Man has

more intelligence, more adaptability, more power, and more cunning, than the animals. That is all.

The proper outlook on life should be as follows :

Life is immortal. What we are now experiencing here on earth is but one stage in a great journey, whose end is God. All life has a meaning, and its progress can be accelerated or retarded. Our central life has relations both with the physical and the spiritual sides of human existence. But while its relations to the physical side are merely temporal, while it inhabits the body, its everlasting seat is in the spirit of man. And just as there are laws of physical growth and health, so also there are laws of the well-being and advancement of the spirit.

Life cannot be lived alone. It is a social product, dependent at once for growth on God, the Giver of Life, and on communion with other lives.

The ascetic ideal is a mistake. Isolation leads to the death of the soul. It is in the rub and bustle of life that character is formed, and character is the food by which life grows. Not the man who hides his talent wins life, but he who puts it out to interest and reaps gain.

True life does not consist in getting, but in giving

not in love of self, but in love of others. The highest character is formed through the life of self-sacrifice for the good of others—family, nation, God.

It should be our privilege to be able to sing with the poet :

Rejoice we are allied
To That which doth provide
And not partake, effect and not receive!
A spark distinguishes our clod;
Nearer we hold of God
Who gives, than of His tribes that take, I must believe.
Then welcome each rebuff
That turns earth's smoothness rough,
Each sting that bids nor sit nor stand, but go!
Be our joys three parts pain!
Strive and hold cheap the stain;
Learn, nor account the pang; dare, never, grudge the
throe!
For thence,—a paradox
Which comforts while it mocks,—
Shall life succeed in that it seems to fail:
What I aspired to be
And was not, comforts me:
A brute I might have been, but would not sink in the
scale.

FOREIGN PERIODICALS

India After the War : Self-Government for India.

is the title of a telling article contributed to the *Nineteenth Century and After* by the Rt. Rev. Dr. Whitehead, Bishop of Madras. We make a few important cuttings for the benefit of our readers :

With a few exceptions it is true to say that the desire for the maintenance of British rule is universal among the great mass of the peoples of India. On the other hand, the last fifty years have seen the rapid growth of an educated class throughout India who have received a Western education, are imbued with English political ideals, and by reason of a common language and civilisation have been inspired with a sense of National unity, and of which the Indian National Congress is the outward and visible sign. Among this class of educated men there has been growing up for the last half-century an increasing desire for a larger share in the government of their own country, a longing that India should have its place in the sun, and the vision of an Indian Nation, independent and self-governing, taking its place with the Colonies of Canada, South Africa and Australia as an integral part of the British Empire. If educated Indians desired a large share in the government of their own country before the War began, that desire will be far stronger when the War is over; if the desire to realise the ideal of Self-Government and to play an honourable part in the history of the world was strong in the hearts of the Indian peoples before the Indian troops landed in France, it will become incomparably stronger after the War.

All Englishmen would acknowledge that these are honourable ambitions and that the vision of the India that is to be is a noble and inspiring ideal, and that there is nothing in this ambition or this ideal in any way inconsistent with perfect loyalty to the British Empire or with the full and frank recognition of the fact that for many years to come the strength and efficiency of the British Government are absolutely necessary if the ideal is to be attained.

There has undoubtedly been a conflict between the ideal of the Englishman in India and the ideal of the educated India during the last few years, and we must expect that the conflict will be more acute after the War. It is not due to the fact that the two ideals are necessarily irreconcilable, but simply to the fact that each of the two races naturally tends to look at the political situation from a different angle and to take a one-sided and partial view of the problem it presents. It is perhaps natural that this should be so, simply because Englishmen and Indians differ so widely in temperament and mental characteristics. We English people are by temperament suspicious of ideals: we naturally fix our attention on present facts and deal with them as best we can: our whole interest is in the *status quo*: we live and work for the present and do not look forward to the future, and that to a very large extent is the secret of our success in the building of the Empire. It has been said that England conquered India in a fit of absent-mindedness, and this is partly true: we did not come to India with any idea of Empire or with any intention of conquering India; we came as traders; we established factories because they were necessary for the security of our trade; we assumed the Government of Districts and States because it seemed necessary to do so for the security of our factories,

and so we were led on by the practical necessities of the case step by step until at last there came out this Empire! We are doing much the same thing now; we are taking one step after another by the education of the people, the extension of railways and telegraphs, the spread of the English language, the training of the people in the arts of Government, the creation of a sense of unity among the peoples of India, and we are thus preparing the way for great political changes in the future; but we never trouble ourselves to look ahead seriously to think what is the inevitable goal towards which we are tending. Sufficient unto the day is the good and evil thereof.

On the other hand, Indians are essentially idealists, their whole interest in the past has been centred in religion, philosophy, and the abstract sciences of logic and mathematics. They have never taken much interest in history; their tendency is to concentrate on ideals, to go back to first principles, to dream dreams and see visions, and largely to ignore the intermediate steps by which the visions and ideals must be realised.

On the one hand, the English officials do not at all realise what a natural and honourable ambition it is on the part of the educated class to desire a greater share in the government of their own country nor how splendid the vision is of a self-governing India; nor can they understand how difficult their position must necessarily be in India from the mere fact that they are foreigners governing a people with an ancient civilisation and history of their own. They forget that no educated and civilised people like to be governed by foreigners however well they govern, and that the desire for independence and Self-Government is a simple elementary fact of human nature. They have always imagined that because they have governed well, their Government must necessarily be popular.

Then, again, it is hard for us to realise the fact that India has a civilisation of its own, which it ought to develop upon its own lines. There are certain principles of thought, morality, social life and political progress which are common to all mankind. It is our duty and privilege to establish these principles in India; but, on the other hand, the exact form which these principles will assume in India is necessarily different from that which they have assumed in England. Our function is to sow seeds and let them grow in accordance with the genius of the Indian peoples. India has got its own contribution to make to the thought, the religion, the social and political life of humanity; but it can never make this contribution unless it is allowed ultimately to grow and develop upon its own natural lines in accordance with its own genius, and this is not possible without political Self-Government.

And then, again, it is difficult for Englishmen in India to realise that in spite of the facts of past history, it is still true that the ultimate basis on which the British Government in India must rest in the future, is the will of the Indian peoples.

Were the peoples of India ever to become fit for independence and wish for independence, the British Government would have done its work and would retire. The idea that we can ever maintain our Government by force against the general will of the Indian people is unthinkable. Even if it were physically possible, our conscience would never allow us to use force and shed blood to maintain a foreign Government in India, if the mass of the people wished for a Government of their own. And

the present War is making it doubly impossible for us ever to try to impose our Government upon the peoples of India by force.

At the same time the present War is surely striking proof that the British Government can take its stand upon the will of the Indian peoples with perfect safety. It has been a wonderful demonstration of fundamental loyalty of the great mass of the princes and peoples of India to the British Empire; and if it has revealed the loyalty of India to the people of England, it has also revealed to the people of India the value to them of the British Empire.

What possible lines of advance are there towards the great ideal of a Self-Governing India?

The first is obviously to increase the number of Indians in Government service and promote them continually to positions of greater and greater responsibility, with the idea that ultimately the British element in the Government will to a very large extent disappear and India be governed almost entirely by Indians. This is practically the policy which has been steadily pursued for the last sixty or seventy years. Lord Morley's reforms were a great step in this direction, and the further reforms which have for some years past been advocated by the Nationalist Party all tend to the same end. This policy undoubtedly is valuable, inasmuch as it serves to train a large body of Indians in the art of administration and to bring the Government more in touch with Indian thought and feeling; but on the other hand, as has been pointed out above, it cannot be regarded as a true solution of the problem that has ultimately to be solved.

One of the foremost Indian politicians remarked very truly a few months ago: 'Even if all the posts in the Civil Service were filled with Indians, that would not constitute Self-Government for India. Self-Government must begin from below. There can be no such thing as Self-Government until the people in every village have learnt to govern themselves.'

The second line of advance is the development of Local Self-Government in municipalities and villages.

It is a minor point but I venture to think that it is a mistake to discourage the serious study of Indian politics in our Indian Universities. We greatly need in India a large body of thoughtful Indian politicians of the type of the late Mr. Gokhale and a great deal might be done to create such a body of men for the State by fostering and encouraging the study of political and social questions in the Universities. I fully believe myself that a school of Political Science in each University, with a body of really able professors to teach the subject, would have a very wholesome and steadying effect upon Indian politics. It would create in each Province a sound body of public opinion; it would discourage wild and thoughtless talk, and it would be able to apply the universal principles of political science to the special conditions of Indian life and society.

A more important point is the cultivation of friendly social relations between Europeans and Indians. It may be true that social relations between Europeans and Indians cannot be quite satisfactory so long as there is political inequality; and it may also be true, as is constantly urged by Europeans, that Indian customs, especially the seclusion of women and the caste rules of the Hindus with reference to food, place great obstacles in the way of social relations between the two races.

At the same time it is a great exaggeration to say that there can be no social relations at all between the two races until these obstacles are removed. I can bear witness from my own experience of thirty years in India, both in Calcutta and Madras, that a very large amount of social intercourse between Europeans and Indians is perfectly possible, and that such intercourse is of the utmost value to both parties.

We need a new attitude on the part of Europeans in India, both official and non-official, towards the peoples of India and their aspirations, a new ideal for our work, a new conception of the ultimate basis of our power. The all-important thing is, that after the War we should cease to talk of the population of India as a subject people, cease to talk of ourselves as a ruling race, cease the effort to impose upon the peoples of India a purely Western civilisation and cease to allow our policy to be dominated by the fear of weakening the position of the foreign bureaucracy.

The Voices of the Night.

Under the above heading a short but interesting article has been published in the *Westminster Gazette* penned by Horace Hutchinson. The writer tells us that the night is seldom if ever "stilly," in fact it is filled and alive with a perfectly astonishing number of sounds.

Says Mr. Hutchinson :

In the comparative calm of the night there is, for many minutes together, no single sound to occupy your attention strongly ; it is distributed, going from one of the little sounds to the other so quickly as to give them an illusion of coalescence, like the optical illusion of the kaleidoscope. It is thus even as you lean from your window. It is thus, magnified multifold, if you pass into that far closer communion with nature which you may establish if you come forth from your tenement of bricks and mortar, which is the fence that modern man has erected between himself and things as nature would have them be, and stand or lie silent on Mother Earth in the midst of all the rest of her children. Believe me you will not then find night "stilly," nor a time when all the good children of Mother Earth are asleep.

Certain of the sounds you will identify, or at least will believe that you assign to their real makers. Of such are the innumerable little patterings, as it were the sound of a scratchy pen travelling over paper, then stopping very short and abruptly—the scribe's idea not too fluent in his mind. These are the footfalls of small nocturnal people going over the carpeting of dry leaves or among the stiff grass blades with hard-shod feet and talons. They may be feet of shrews or voles, or even of larger creatures than these ; but the majority of the pattering and the scratching will be done by the insects, because they are far more numerous and incessantly busy—the ants, the beetles, and so on. And generally it is the fallen leaves that play the part of sounding-board to it all. One of the many correspondents who are kind enough to write me on the subjects of some of these short essays in the *Westminster* describes this process vividly. "Walking," he says, "in my garden on a quiet November

evening, I used to be astonished by hearing a constant rustling of dried leaves on the ground, always ahead of me. It was too late for birds to be about. I wondered, could it be mice, and would they be so numerous and omnipresent ? I decided in the negative, and then tried by the quietest and slowest approach to stalk the mysterious beings who rustled the leaves. After many failings I at last succeeded, and discovered they were Darwin's favorite earth-worms, who were busy pulling the withered leaves into and down their holes, I suppose to provide themselves with nourishment during the hard weather which lay before them. It then became a pleasure, while promegading the garden by day, to notice the leaves in scores that were more or less dragged into the worm-holes. They were twined round as we twined a sheet of paper round a bouquet of flowers, and I think the stalk and narrow end were always pulled in first.

There is one mood of Nature and one only in which the night, for the watcher, is not filled with these innumerable, scarcely palpable sounds. When all the world is wrapped in the garb of snow the activities of very many of the nocturnal creatures are checked ; this check of the activities occurs as a result of the low temperature simply, and we find it at times of a hard and crisp frost, no less. But the snow, besides being an enervator of vital forces, acts also as a muffler of all sound that creatures still have enough vitality to produce. It is not a time at which the watcher will care to remain watchful for long, by wood or fell. You will be the less tempted to dally because all except the louder voices of the night are hushed. It is, as it were, a dead world, or a world of arrested life. The very silence is so oppressive as almost to seem audible. You may go home, to your far more grateful fireside, with the impression that not a living thing has been stirring about you as you held your brief nocturnal vigil. And then coming forth the next morning and going to the same place, you will perceive the tell-tale face of the candid snow as it were riddled with wrinkles formed by the footprints of little creatures that must have been going to and fro all about you, even while you watched, though you saw and knew nothing of them.

Sir Robert Hadfield writing in the *Review of Reviews* presents some of the

Problems of Industrial Training

and tries to find out a means to solve them.

Says he :

I In my opinion neither the scientific man nor the practical man wholly fulfils the required conditions for the direction of great modern affairs. By the practical man I mean the man who has received a good secondary education, but not special scientific culture and by the scientific man I mean the man who is completely instructed, but is a stranger to actual experience and practice.

It usually happens that the scientific man is as necessary as the practical man, but neither the one nor the other is a satisfactory organiser, because they do not unite in one head the combination of the two indispensable elements. It is therefore necessary to

arrange our educational courses so as to combine the two ; in other words, to find a third type of man in whom such knowledge will be united. The solution of the problem is not easy, but it is more than ever necessary that at the present time such a new type should be evolved and developed.

Until quite recently many mistakes were made, either because the scientific man had been installed in view of his special knowledge or, at the other end of the scale, the practical man was given the preference. In a general way neither of these types has been a success.

The scientists can certainly do excellent work in his laboratory, but generally speaking, he will only be able to render these services in this one capacity, because he has not had the opportunity to adjust his theoretical knowledge to industrial conditions. The practical man also in his vocation is able to do good work, but it is doubtful whether in these days he can ever furnish work of the highest order.

How then are we to obtain this important combination ?

Naturally the best path to follow is that of scientific education, but on condition that instruction furnished by practical observation is not neglected.

All things considered, the scientist will certainly be in a better position, but if he does not possess the necessary turn of mind and the natural qualities to which reference has been made, this education which should have given him a great advantage may cause his ruin. It may prevent him from attaining the height of success to which he might have reached by applying his knowledge to practical ends. He remains in the same sphere, and cannot emerge therefrom.

The combination of science and practice is of the greatest importance, but it is doubtful whether it can be obtained by education alone. In order to attain the highest degree of success a man requires something even more than education, that is above all he must show personal application.

The *Spectator* has an article on

The Higher Indifference

which provides interesting reading.

There is a sense in which we must all, in self-defense, cultivate indifference. Some indifference, both intellectual and emotional, is part of the necessary armour of the man whose mind and whose sympathies have been systematically developed. We have all certain subjects upon which we dare not think. We administer to ourselves the soporific of consciously induced indifference whenever they present themselves before our eyes.

But the higher indifference is no matter of narrowing areas. It is not an effort to avoid thinking, but an

effort made by thinking to avoid pain. Doctors often attain to it. They cannot turn away even from such ills as they cannot cure and cannot effectually assuage. They are not, however, more unhappy than other men, neither are they more hard-hearted. There is, of course, a minority of case-hardened doctors who are very brutal, but they form an almost negligible minority. The good medical man dwells—it is his duty to dwell—upon every detail of the suffering before him, and he offers sympathy to the patient which is in no sense insincere, but which does not interfere with his sleep or his appetite, his enjoyment of life or his scheme of the universe. He will never speak cruelly, he will never perhaps even think hardly, of any single case that he attends. His indifference is neither callous nor careless, but it serves him as a complete protection all the while that he is under fire from the enemy's guns. He induces it by will-power. In his endless fight with pain he could not afford to go unarmed.

To attain to the higher indifference is the moral ambition of a great number of very good people who are not doctors. Philanthropists, for instance, try, and usually succeed ; but some of them in their efforts fall into that lower indifference which, while it protects the professional benefactor from distress, also impedes his efforts, and sometimes renders him useless altogether. Either he becomes an indulgent cynic whose influence is never very great or good, or else he becomes an academic correctionist, a lawgiver whose law remains a dead letter—murmuring "Thou shalt not" over his office table, but little heeded by the accused persons who appear before his bar, and whom he is powerless to help or punish, being incapable of either sympathy or indignation.

Among the best strivers after indifference are the would-be stoics. Pride forbids them to be overcome by grief and pain, whether their own or another's. They pretend to great strength of mind. They think by allowing no show of feeling to master all emotion. They make no harsh profession of indifference. They try to keep their minds on what they describe to themselves as a "plane" above distress and conflict. In reality they do but make a strong effort of concentration, and in the effort occasionally break down altogether and injure themselves mentally. Nature will not have us to be proud. If we take trouble simply, crying out in moderation and admitting our misery, she will console us by that remedy of time in which no one ever put any faith, but which does heal, nevertheless, most of those who are not too proud to give in. Time is the great anti-faith-cure doctor, whom all his patients distrust but who fails seldom.

Certain mystics have lived, and we suppose do live now, in a state of mind which might be described as indifference. But all mystics, big and little, are in a sense refugees. They have fled before the terrors and puzzles of the actual. They have found a refuge, but they have chosen to live aloof from the waking world, and the waking world is uneasy in their presence. The refusal to suffer is not always an ignoble thing, but it is not so noble as endurance.

TO THE MEMORY OF Mr. K. OKAKURA

Your great heart shone with the sunrise of the East
like the snowy summit of a lonely hill in the dawn.
Rabindranath Tagore.

Before the memory of this pilgrimage fades I want to record my impression of the days spent at Idzura. This place is sacred to the memory of one of the greatest of the sons of modern Japan, and one to whom Bengal owes a deep debt of gratitude.

The name of Okakura is probably well known to the readers of the *Modern Review*, so I need not say anything of his life work in Japan and the part he played in the Renaissance movement in Bengal. The thought of his influence is in my mind as I write, for I am staying with Rabi Babu at the seaside house of the late Mr. Okakura, one of those lonely great men who do so much to shape the thought and history of nations.

We started for Idzura from a beautiful place in the hills. There we had met the graduates of the Tokyo Women's University who had gathered together for part of their summer vacation in order to think of the deeper things of the spirit. These women students with their deep devotion had listened to the message of their Bengali guest, and had served him with their love and reverence. They stood on the station platform to bid him farewell, and garlanded him in Indian fashion with a garland of everlasting flowers from the hills.

When we entered the carriage which had been reserved for the poet, I saw a beautiful bunch of wild flowers by his seat. These had been placed there by the Station-master as a token of his respect for the visitor from India. This was an example of what has struck me so much in Japan, even when travelling by myself, when I have been able to observe the railway and tramway officials in their treatment of the common people, namely, that the Japanese remain human even when they become officials. All through our travels in this land of flowers we have seen how the official has still his human heart, and does not allow the fact that he is an official to turn him into a mere machine for the

carrying out of the orders of the higher authorities. It has more than once occurred to me that if only in India those of my own fellow countrymen who occupy the position of officials, could keep that human touch with those whom they are paid to serve, there would be more of happiness and contentment in India, though perhaps there might be less of efficiency.

The place we were bound for was the seaside residence of the Okakura family to which we had been invited by the widow and son of the late Mr. Okakura. The day was a rainy one, but fortunately the rain stopped just as we reached the station of Idzura. After leaving the station we had to pass through the village which is a fairly large one. The straggling street was lined on both sides by the village people, who could be counted by hundreds or even thousands. They had read in their daily papers that the Indian seer was coming to visit their village, and all had left their work and had come from their fishing boats and the fields and their shops to have a glimpse of him as he passed. It was a remarkable sight to see these weather-beaten peasants and fisher folk standing in respectful silence as the poet passed by. It was eloquent of the close touch that there has been between the India of the sages, the land which gave to the world the Buddha, and Japan, which even in these present times has not forgotten the debt she owes to India. Japan still has in her heart of hearts a true reverence for this ancient land and even the modern Western civilisation which she has acquired with such wonderful ease had not been able to rob her of her inner spirit of tranquility and reverence for beauty. As we passed through the rice fields on our way to the house outside the village, at every group of houses there were villagers standing silently watching as the poet passed.

When we reached the entrance to the garden we were welcomed by Mrs. Okakura who took us into the house. It stands on a rocky point at one side of a bay

LATE MR. OKAKURA'S SEASIDE HOUSE

This picture shows the artist's favorite room.

which holds in its quiet safety a little fishing village. In front of the house, overlooking the sea, is a small summer house which was the favourite room of the late Mr. Okakura. There Rabi Babu sat during the day, and wrote, or watched the fishing boats as they passed out of the bay into the open sea.

This evening, as I write, the music of the waves comes up from the bay and the shouts of the children playing on the beach mingle with the sound of the breakers of the sea.

We have just returned from the tomb of the late Mr. Okakura, before which incense filled the evening air with its fragrance. The tomb is a grassy mound with no stone on it, but a small garden by its side. As we stood before this green mound in the fading light a little fir tree was brought, and in the presence of Mr. Okakura's son Rabi Babu planted this tree in memory of his friend.

Then a bronzed fisherman came up and

placing some sticks of incense before the tomb made his obeisance before it. We were told that he was the fisherman who always used to accompany Mr. Okakura when he went out fishing.

Last of all the children of the family came and made their *namas* and as we turned away and walked back to the house they came round me and began timidly to sing the first lines of a Bengali song which I had tried to teach them the day before.

“জীবনে যত পূজা

হল না সারা

জানি হে জানি তাও

“ হয় নি হারা। ”

They did not know the meaning of the words, but as they sang I felt how true they were and how even before the grave of this great man's mortality we could feel sure that his work is not lost nor his worship finished.

W. W. PEARSON.

GLEANINGS

A Danish Artist on the Ajanta Cave Paintings.

The annual Report of the Archaeological Department of His Highness the Nizam's Dominions for the year 1914-15 A. D. is an interesting publication. We learn from it "that the view, advanced by certain antiquaries, that the Ajanta frescoes were in a state of rapid deterioration has proved on careful examination to be without any foundation. Sir John Marshall is of opinion that with adequate care the frescoes may last for several centuries more; while any attempt to remove them with a view to protect the frescoes will prove absolutely disastrous. During the visit of the Director General to Ajanta, M. Axel Garl, a Danish artist of great culture, was also asked to inspect the caves. His note on the art of Ajanta, which is attached to the Report, is of great interest." This note is reproduced below

The water-paintings in the rock-caves at Ajanta exhibit the classical art of India. That is to say they represent the climax to which genuine Indian art has attained, and they show the way to be followed by Indian artists

They belong to different periods and represent great varieties of style and different degrees of artistic value. But in these notes only the best of them are referred to, as they are to be seen in sadly damaged conditions, especially in caves Nos. 1, 2, 16 and 17.

I

The colours are deeper and often purer and the whole scale of colours is far richer than in other stucco paintings of similar dimensions (Egyptian tombs, Pompeyan houses, Italian churches from the Middle ages, etc.). Even though the many centuries may have given the rock-walls in Ajanta a harmonious veil of patina, which they did not perhaps possess fifteen hundred years ago, the combination of colours within the single groups, and in the individual figures show that the painters were guided by a highly developed sense in their blending of colours with a view to the total impression to be produced.

II

The composition of the wall paintings is exquisite. It is characteristic that the larger the figures are in proportion to the surrounding space, the better is as a rule the whole composition. It seems that the best artists have preferred to use the larger figures in their pictures.

The picture tells its story plainly in a manner which nobody can fail to understand. The eye is directed by the main lines of the composition towards the chief characters, which also attract our attention by their large size and by their carefully calculated position that has been given to them in the almost endless number and variety of figures.

Whenever superhuman beings, men, animals and plants are represented the three dimensions are observed with realistically executed contractions, and with true perspective in regard to lines and planes. But buildings and grounds are done without perspective, the walls being left unbroken and the plane remains undisturbed.

But however schematic and conventional these rocks and houses, gateways, pavilions, etc., look to us, they are excellently fitted to serve the purpose of dividing one picture from another on the same wall, of giving the setting of the picture, and of affording rest to the eye in the multitude and rush of figures.

III

The form is marked by a sharp and clearly accentuated outline. The contour is so true to nature and so well done, that combined with a perfectly correct volume it gives even in cases of the most difficult contractions a perfect impression of shape—even when the surface is nearly monochromatic with only a slight deepening of the colours along the edges.

Although no use is made of light and shade, the effect of shape, sometimes even of relief, is secured, and the plane is preserved as a matter of principle.

This technique which reaches its climax in a Bodhisattva figure (of more than life size in cave No. 1), bears a striking resemblance to that of Michael Angelo. If one placed a good photograph of this Buddha head by the side of a photograph of a figure from the Capella Sixtina one might be inclined to think, if no attention were paid to the different types of the figures, that they were painted by the same master.

A further aid in the matter of expressing form the Ajanta artists have found in an extensive use of ornaments. *Karas*, necklaces, bracelets, earrings, veils, ties, slings, flower garlands, etc., are drawn with such skill, are laid around a neck, a finger, a breast in such a manner, that the whole surface takes its form from it.

The folds of the garments, as well as their borders in all their simplicity are written with a remarkably sure hand and with an astonishing knowledge of the form underneath.

If the figures are moving such ornaments are used to give an impression of the speed. There are flying figures whose rapid movements are suggested most vividly, for instance by the heavy pendants swinging out almost horizontally.

IV

The figure style is highly developed and testifies to a thorough study of the human body. Every stillness, symmetry or mere monotony has been

overcome. The axis of most of the figures changes several times from head to feet without any apparent disturbance of the natural poise and balance. And one meets an unlimited freedom in the choice of postures and movements. Even those that are most improbable get appearance of life and reality. A group of beings (in the vestibule of cave No. 17) are flying on without wings—with movements so large and free and with a poise so graceful, that one has no doubt that this is their natural manner of moving about.

This perfect freedom in the painter's handling of the human body places Ajanta one thousand years ahead of all other paintings that we know. There is no exhibition of the painter's knowledge of Anatomy, nor is there—with a few exceptions—any offence against Anatomy. The Hindu racial type is simply concentrated and intensified in this art; and thereby have been secured a gracefulness and an expressiveness in the representation of the human body the equal of which it is hard to find anywhere.

Figures like those of "Primavera" by Botticelli may be called the sisters of some of the female figures in Ajanta (in the cella on the right in cave No. 2).

V

Behind those masterpieces lies a great and thorough study of nature. Not only the individual painter's independent efforts to master the form of nature, but also an experience and a tradition that have been cultivated patiently and industriously in an artistic school. And what we find here is not only great knowledge but also much practice. Everything in these pictures from the composition as a whole to the smallest pearl or flower testifies to depth of insight coupled with the greatest technical skill. That is what makes it possible for the artist to transcend reality as he does so often to express what is the distinctive aim of all oriental art, the soul, the spiritual side of the existence. He does not thereby violate the truth.

However unnatural and artificial an eye, for instance, may appear to the inexperienced observer, the connoisseur will discover with astonishment, that the anatomy of the eye is so well understood and so well reproduced in the drawing, that these strange and peculiarly curved lines cannot possibly represent anything else in the world except just a human eye.

A principle by which all Western artists are guided is to study nature and to learn from the antique. What has been said above shows that the ancient Hindu masters must have followed a similar way; combining the tradition of the school with individual study and practice. If genuine Indian art is to experience a renaissance it is that same principle which must still be followed. Europe got its renaissance through learning from the Greek antique. India will get hers if she turns to Ajanta and goes to school there.

Whoever wants to serve the cause of pure Indian art will find his masters here, in whose steps he must strive to go. He will do as they did, first of all study nature to master the secrets of form, volume and movement. But then he will go to Ajanta to cultivate his sense of deep and harmonious colours, of distinct and full composition, of expressive and pleasing lines and last but not least of genuine Hindu figure style. As he lives and studies among their works, he will catch something of their sacred fire, until in him he feels the heart vibrating while the hand draws a clear and bold line. That is why those

old Buddhist masterpieces so often leave on the observer the impression of a prayer or a hymn of praise.

An Effective Artificial Hand.

The construction of an artificial hand that shall be capable of natural movements and of the exertion of strength through attachment to the muscles of the fore-arm is now, apparently, approaching very near solution, owing to the investigations of two Swiss professors, Dr. Sauerbruch, a surgeon, and Dr. Stodola, a professor of mechanics, both of Zurich. The problem has two parts, a physiological one—the adaptation of the muscles to the artificial fingers, and a mechanical one—the construction of an artificial hand that shall be as strong and as capable of varied motion as the real one. Professor Sauerbruch relates his experiences in an article contributed to the *Medizinische Klinik* (Vienna). Despite the progress already made and the still greater progress likely in the immediate future, he warns us at the outset that the patient's own skill, as developed by practice, will remain an important factor in the successful use of artificial limbs. Says Dr. Sauerbruch:

"Of all limbs, the most delicate is of course the hand, and the most arduous problem, consequently, is to impart natural movement to artificial fingers. Even the artificial hand of the newest model, with its electrical springs, and so on, lacks the spontaneous faculty of seizing objects.

"We have had heretofore no surgical or mechanical solution of the problem. When I returned from the front, I met by chance Dr. Stodola, professor of mechanics at the Polytechnical Institute of Zurich. He suggested the possibility of constructing a normal hand, provided the surgical part of the problem could be satisfactorily solved. I immediately began to experiment with various animals and soon reached the conclusion that it was possible, after the amputation of a limb, to preserve in the remaining sinews and muscles sufficient plastic strength for purposes of motion. After this I operated on human bodies, and finally on six wounded soldiers, with most satisfactory results.

"That the operation may be successful, it is absolutely necessary that the sinews and muscles to be used be sufficiently retracted. The formation of a solid arm-stump is also of great importance. The problem is both surgical and physiological, and every case demands individual, careful treatment. If the operator proceeds too soon, he may lose all chances of success.

"After I had published Professor Stodola's and my own first results, my attention was called to the fact that in 1899 an Italian surgeon, Dr. Vanghetti, had described the theoretical and experimental basis of the process, and had given to the world his further researches in a monograph, published in 1906. After this, Professor Ceci, of Pisa, made three successful operations. To my great surprise I found, in the course of my own investigations, that as far back as 1867 Larrey had proposed to use the muscles of the stump to impart motion to an artificial hand. To come down to our own time, a Hungarian physician, Dr. Nagy, suggested, in 1915, that in the loss of single fingers, the sinews might be energized by enveloping them with skin. Professor Korte also has written me that he has experimented successfully on a Russian invalid, using the sinews of a fore-arm-stump for the vivification of an artificial hand.

"The Prussian War Department placed at my disposition a military hospital at Singen, and here our

success was beyond expectation, so far as the surgical end of the operation was concerned. We found, for instance, that in a plastically transformed forearm, by shortening its muscles by $1\frac{1}{2}$ to 2 inches, a lifting force of 22 pounds may be developed. The flexing muscles of a forearm-stump perform, on an average, a work of 2 to 3 foot-pounds. The fear that these

A CLAWLIKE SUBSTITUTE FOR A HAND.

Compare this device with the artificial hand shown in the next column.

wonderful results might be but temporary has not been justified. On the contrary, with constant use the strength of the artificial hand grows.

"The technical part of the problem has a long and successful history behind it. . . . Relying partly on the experiments of his predecessors, Professor Stodola constructed his hand, whose fingers are put in motion through a set of pulleys. The transfer of force to the single fingers does not depend upon the position of their neighbors. Thus it is possible to embrace completely objects of any shape, the fingers being able to conform to the irregularity of the surface.

"We have, of course, to admit that, so far, most of our artificial hands have been constructed with an insufficient knowledge of the physiology and anatomy of that limb, and are therefore practically useless for the new purpose. Henceforth, surgeon, physiologist, and technician will have to work together.

"In brief, in view of the results so far obtained, I

A LIFE LIKE ARTIFICIAL HAND.

The upper picture shows how the hand is shut with the forearm bent. Below, on the reader's left, is shown the method of attachment. In the third picture the wearer is bending the arm with the hand open. The forearm muscles control the fingers.

am justified in making the statement that the surgical part of the problem can be considered solved, and that there is no doubt that, in the course of time, the technicians will satisfactorily solve their part of the task also.

"Almost every trade develops its own hands. Thus, the weaver, after losing his arm, is again able to work, if he can, at will, open and close two hooks modeled after thumb and forefinger, this motion being necessary to fix properly the treads at the weaving-loom. With the new method we are confident that we shall solve this problem of vocational differentiation.

"And let us not forget the psychological result. How happy our invalids will be in regaining their former appearance!"—*The Literary Digest*

REVIEWS AND NOTICES OF BOOKS

ENGLISH.

THE PRESS AND THE PRESS ACT. *K. Vyasa Rao, B. A. As. 10. Srinivasa Varadachari & Co., Madras.*

This is a pamphlet with the object of whose publication we are in entire sympathy, though in some matters of detail we cannot endorse what the author says. Its publication is very timely. The writer puts his case against the Press Act of 1910 ably, and has succeeded in proving that it was *not* a piece of panic legislation but one undertaken quite deliberately, possibly as a sop to the Anglo-Indian bureaucratic Cerberus. The Press Act must go. If the bureaucracy will not agree to its total repeal, the executive should be deprived of the power given by the Act of demanding, exacting and forfeiting a security without any reference to a judicial tribunal. At every stage there should be the intervention of a law-court. No security is to be demanded except in pursuance of the judgment of a judicial tribunal, and so on. But these are only suggestions by way of compromise. The Indian demand is for the repeal of the Act. We do not accept the author's suggestion that the Penal Law against the press may be made severer if the Press Act be repealed (pp. 37, 53). The Penal Code is already more elastic, vague and rigorous in the case of conductors of newspapers than it ought to be.

The importance of the press is very well brought out in the following sentences:—

"In the progressive evolution of political institutions, if the 'Government' has come to be recognised as the supreme static force of a society, the press has at the same time come to be acknowledged as its vital dynamic force. It may pass for a maxim now-a-days that just as order without a settled government is impossible, so is progress without a *free* press impossible..... We in India have only the Crown represented by the executive, as our legislative chambers are no more than a part of the mechanism of the executive. Under such conditions, the press in India is practically the only other estate of the Realm, besides the Executive. No statesman, who is more than a mere official, can afford to conceal from himself the fact, that the constitutional status of the press in British India as an estate of the Realm deserves to be protected from subordination to the executive."

The author exposes the absurdity of the provision which enables the executive to demand security even before any offence has been committed, by asking:

"Will a government feel justified in asking security of a medical or legal practitioner, because he may commit an offence in following his profession? Does it demand security of its own servants, because they may offend against the law of bribery? Does it demand security of a merchant, because he may employ false weights and measures or sell injuriously adulterated articles, or pass gilded brass for solid gold? Of which professional man, of which public servant, of which banker who receives public money does the Government take security as a preventive

punishment in advance? How then can it be justified that if one should start a press or a journal he should be liable to furnish security, merely because the executive desires to control the press more than it controls anything else?

It may be contended that the function of journalists differs from that of other men in that the former may disseminate opinions or principles subversive of the state. But may not any author, or any man who opens his mouth to speak, do the same? Why not then take security from *all* citizens? Military officers and soldiers may try to subvert the state, as they have done in all countries in some age or other. But no security is taken from them. True, rebellious officers and soldiers may be court-martialled and punished. But offending journalists may also be prosecuted under the ordinary criminal law.

MUSLIM HOME. *Part I A Present to the Married Couple. By H. H. Nawab Sultan Jahan Begam Sahiba, C. I., G. C. S. I., G. C. I. S., Ruler of Bhopal, India. Calcutta, Thacker, Spink & Co. 1910. Cloth, Pp. 177. 74. Clearly printed on antique wove paper.*

In this lucidly written book, Her Highness the Begam Sahiba of Bhopal gives an exposition of the teachings of Islam on the conjugal relation, and shows what rights women have, or rather ought to have, according to Muhammadan Law. Muhammadans who are already married and those who are about to marry will be benefited by a perusal of the book. Non-Musalmans, too, will do well to read it; as it will give them a correct idea of the position of women in Islamic society, and will teach them to respect women and treat them kindly.

"The last word of advice which the Holy Prophet of Arabia had to give to his companions and through them to the whole world was to respect and maintain the sacredness of female right. 'The rights of women,' how nobly he exhorted, 'are sacred; see that women are maintained in the rights attributed to them.' 'Fear God, in regard to the treatment of your wives, for verily they are your helpers, you have taken them on the security of God.'"

Regarding the positions in life and duties of man and woman Her Highness writes:—

"In all Islamic teaching one does not fail to find a clear tendency to create equality between woman and man. The two sexes are, however, meant by nature, to perform separate duties and, therefore, do differ in their nature and constitution.

"If woman was, therefore, given the charge of domestic duties, man required to fight the hardships of the times. To secure peace and safety to life and property consequently fell to the lot of the stronger sex, who got therefore, a sort of precedence over the other. This one superiority in man was a necessary sequel of the respective part man and woman had to play in the propagation and protection of mankind; otherwise they were meant to be equal to each other in every other respect."

There can be no question that the rearing of

children is the peculiar duty of women. But surely they ought to and can do their social and public duties in addition to the domestic ones. For examples to clinch our argument we need not go far; Her Highness is herself a noteworthy example. In times past in India the Sultana Razia, the Empress Nur Jahan, Queen Ahalya Bai, &c., did their public duties well. In Bengal and elsewhere many women have managed big estates with great ability. In all countries in which women have the franchise, they do their political work as well as men.

The late Mr. W. T. Stead wrote in the *Chicago Chronicle*, December, 1903.—

"It is one of the advantages of monarchies that they afford women an opportunity of displaying their capacity for the direction of the affairs of State seldom possible to their republican sisters. Queen Victoria was a signal instance of this. She was, during the latter years of her reign, the most experienced member of the groups which govern the Empire. No male sovereign ever took a closer, more constant, more conscientious part in the direction of the State than did Queen Victoria, who, oddly enough, although exercising political functions absorbing her life, had a crazy horror of any other woman devoting even a fraction of her time to the study of political questions. She was a most brilliant example of what woman can do in the realm of statesmanship and the most ruthless opponent of the interference of woman—excepting herself—in political affairs.

"Queen Victoria was not alone among capable women who sit on thrones. The dowager Empress of Russia, the Queen regent of Spain, Queen Natalie of Servia, Queen Carmen Sylva of Roumania form a distinguished group of women whose political capacity was at least as their husbands'. To mention only one instance, it is an open secret that if the dowager Empress of Russia were but allowed to have had her way there would have been none of the interference with the constitutional liberties of Finland which stain so black a blot upon the present reign."

The book consists of the following chapters: Man and woman and their relative position, Marriage, Polygamy, Nuptial Rights, Mutual fidelity and love. Some measures to avoid ill-treatment and keep peace in the family, Separation between mah and wife, *Khula*, *Iddat*, Inheritance, and Kinsmen.

Her Highness's observations on polygamy are reasonable so far as they go. She shows that the teaching of the Quran strongly recommends monogamy, and that polygamy is allowed only under special circumstances, up to a certain limit, and under safeguards. But it cannot be denied that these circumstances have generally been lost sight of and the safeguards have not been of much avail, so that in modern times, among civilized peoples, perhaps the Musalmans are more polygamous than others. The authoress looks at the conjugal relation more from the point of view of the propagation and preservation of species and the maintenance of women than from any other. This has prevented her from seeing that even under the most favorable conditions polygamy prevents the development of the finer and finest phases of man's nature in relation to woman and of woman's nature in relation to man. Just as the ideal of womanly virtue is for a woman to be devoted to one man, so is the ideal of manly purity to be devoted to one woman, be she barren or the mother of children; be she sickly or healthy. In a polygamous

society, or in one in which polygamy is or can be practised without legal prohibition or social obloquy, these inter-dependent and complementary ideals of manly and womanly purity cannot reach full development; consequently a certain coarseness of tone as regards the sexual relationship cannot but characterize such a society. The ideal is for one woman to be the devoted wife of one man who is devoted to her alone. The condition of a prostitute is the worst imaginable. She is worse than a mistress, a mistress is worse than the legally married wives of a polygamous man, and these co-wives are worse than the single and only wife of a devoted husband. Of course illicit polygamous relations are worse than legal polygamy.

The Begam Sahiba expresses the opinion that "Virtue in woman should be given the chief consideration in the selection of a wife," and quotes "the following wise words of our Prophet" in corroboration:

"A woman may be married by four qualifications: one, on account of her money; another, on account of the nobility of her pedigree; another, on account of her beauty; the fourth, on account of her virtue. Therefore look out for a woman that hath virtue, but if you do it from any other consideration, your hands be rubbed in dirt."

The authoress also quotes the saying of Muhammad: "The world is provision, and the best provision of this world is a virtuous woman."

All these sayings of Muhammad may be commended to those who exact a "price" for their sons from the brides' parents.

Husbands, irrespective of the religion they profess, will do well to remember Muhammad's saying: "The best man among you is he who is best to his wife." Also the verse in the Quran where it says: "Women are a garment to you and ye are a garment to them." (Chapter ii, 187). The Begam Sahiba's explanation of this last sentence is worth quoting. "As garments are intended to cover person and things to be concealed, men and women are said to be as garments to each other, that they may hide each other's failings; and it need hardly be said how much this duty is necessary to the well-being of society."

As regards the duty of the wife to obey the husband, the authoress writes:—

"The husband is to be obeyed even above the parents. Obedience to parents is enjoined upon all children alike,.....but in view of the rights of the husband, married women are not bound to the same duties towards their parents as their unmarried sisters; for a woman her first duty is to her husband, which is also her highest duty. But it must be remembered that parents or husband shall only be obeyed so long as obedience to them does not constitute a sin in the sight of God. Holy Prophet has said that 'no obedience is due to a creature in respect of any sin against the Creator.'"

Islam allows divorce "only in extreme cases when there is no help left. The Holy Prophet is reported to have said: 'The most hateful of lawful things in the sight of God is divorce.'"

One of the most beautiful things contained in the book is "the following tradition from the Holy Prophet":

"Abu Hurairah reports that a man said, O Prophet of God, who is most worthy to do good to? The Prophet said, Thy mother. He said, And after her? He said, Thy mother. The man said, Then after her? The Prophet said, Thy mother. The

man said, Then again after her? The Prophet said, Thy father." R.C.

THE TALE OF THE TULSI PLANT AND OTHER STUDIES is the title of a book from the pen of Mr. C. A. Kincaid, a Bombay Civilian. The book contains faithful Puranic accounts of the three well-known plants held in high regard by the Hindus, viz., the Tulsi, the Bel, and Sami Tree and a few exceedingly interesting cameos of Maharatta history and Chivalry. The tales regarding the plants are taken from the Puranas as well as from the stories current about them in the Bombay Presidency. Mr. Kincaid's study of Maharatta history has not been with a view to find fault with everything that is Indian. He appreciates the chivalry and heroism of the Maharattas and does not share the opinion with so many European writers of Indian History that Shivaji was a freebooter or those illustrious Maharatta Statesmen and Generals who followed him were actuated by feelings of self-aggrandizement and plunder. The author is thoroughly familiar with the highways and byeways of Maharatta country and history and has tried to put a romantic surrounding to them.

The get-up of the book is good but it bristles with misprints. RANENDRANATH BASU.

SOME FACTORS AFFECTING THE COOKING OF DHOLL (CAJANAS INDICUS) by B. Viswanath, T. Lakshmana Row, B. A., and P. A. Raghunathswami Ayyangar D. A., Assistant to the Government Agricultural Chemist, Madras.

Everyone is familiar with the fact that cooking qualities of different dholls (Rahar in Bengal) like all other pulses, vary considerably. Some cook very quickly and others taking a long time to reach the desired stage and it is the common object of all consumers to have a kind of the former type. The present memoir is one of the publications of the Chemical Series (Vol. IV, No. 5, April, 1916) of the Department of Agriculture in India, Pusa, and the authors have dealt with the following factors affecting the cooking of Dholl:

(1) The effect of the composition of the water upon the rate of cooking.

(2) (a) The influence of the fat content.

(b) Differences in the rates of cooking due to variety.

(c) Differences in the rates of cooking due to methods of preparing the dholl

(3) The influence of various Salts on the liquefaction of Starch.

The following results of their experiments may be interesting.

1. Dissolved Salts, such as are found in natural waters exert a marked influence on the time taken to cook dholl.

2. Calcium and magnesium salts and the chlorides of hydrogen and sodium exert a strong retarding effect. Whereas alkalies and alkaline carbonates have the reverse action.

3. Whether the action exerted by any Salt is a retardation or an acceleration, the effect is approximately proportionate to the concentration, i.e., the harder the water the slower is the rate of cooking.

4. The addition of Sodium bi-carbonate or sodium Carbonate to a hard water materially hastens the cooking.

5. The rate of cooking of dholl is approximately proportionate to the rate of solution of the dholl substance, i.e., to the rate of solution of the proteid and starch.

6. The proportion of proteid to starch dissolved is not constant but varies with different solutions. Alkalies and alkaline carbonates dissolve a greater proportion of proteid than starch as compared with pure water, whereas hydrochloric acid dissolves a greater proportion of starch. In addition, alkalies and alkaline carbonates greatly accelerate the rate of cooking.

7. The rate of solution of the proteid appears to be the factor which mainly controls the rate of cooking.

8. The fat content of the dholl plays a very unimportant part with regard to the rate of cooking.

9. Dholls of different localities have varying rates of cooking.

These results have been obtained under conditions prevailing in south India but the conclusions arrived at, in the opinion of the authors, will hold good generally.

We wish the authors every success in their future investigations.

DEBENDRA NATH MITRA, L. Ag.

JAINISM NOT AN ATHEISM AND THE SIX DRAVYAS OF JAINA PHILOSOPHY by Mr. H. Warren, Hon. Secretary, The Jaina Literary Society, London. The Central Jaina Publishing House, Arrah. Presented by Kumar Devendra Prasad, Editor, The Jaina Scripture Gift series, Arrah (India). Price - A Careful Perusal.

Mr. Warren is an eminent writer on Jainism. The booklet under review contains his two essays originally published in some Jaina periodicals. The first of them which has been translated into vernaculars and distributed among the people, aims at to prove that Jainism cannot properly be called an Atheistic religion as is generally believed. More can be said on both the sides of existence and non-existence of God than what Mr. Warren has actually said in refuting the latter view, but the kernel of his essay is good and right which we are glad to reproduce:—

"Jainism does not deny the existence of God (Paramatman). God is described in Jaina scriptures, but there is a difference between the description of God as given in these books and the description given in the religious books of other faiths. The chief difference is that while God is described in the books of some other faiths as being a creator and ruler, God is not so described in the Jaina books. God according to the Jaina description is an all-knowing and perfectly happy soul with infinite capacities of activity, a pure and perfect soul without any material body, a being that cannot perish or become degenerate."

THE IMPORTANCE OF VEGETARIAN DIET by Chhaganlal Paramanandadas Nanavaty, Assistant Manager, The Bombay Humanitarian Fund, Published by Lallabhai Gulabchand Jhaveri, Honorary Manager, The Bombay Humanitarian Fund, 309, Shroff Bazar, Bombay. (Intended to be freely distributed.) Pp. 31.

The Bombay Humanitarian Fund alias The Shri Jivadaya-jaana-prakashaka Fund at Bombay is the only well-organised body deserving of mention in India which earnestly advocated the vegetarian diet following the line adopted by the Order of the Golden Age, London (153, 155, Brompton Road, S. W.) of which the Herald of the Golden Age is an organ well-known to those who are familiar with the movement. The booklet under notice is apparently compiled from the

various pamphlets issued from time to time by the said Order of London; and so it supports from various points of view the necessity of vegetarian diet describing the evil consequences of animal food of which the people are completely blind. So rightly observes Sir William Barnshaw Cooper:—"In arts and science, in medicine and surgery, and in social culture, the human race has progressed by leaps and bounds in comparatively recent years, and yet there is one vital question, indeed, the most vitally important of all that still remains almost uncared for, unconsidered, and regarded as of no moment in the economy of human existence. In working out his own earthly destiny, it seems strange that Man should, consciously or unconsciously, overlook and neglect that very thing upon which the material body itself depends for the accomplishment of the great purpose of life—Food.

It has been truly said that the proper aliment of the human body is not in the least understood by our great scientists, and, if this be so, it may well be asked—what is the use of learning, of scientific discovery, and of intellectual development, if the comparatively simple matter of bodily nourishment remains an unconsidered item in the life's economy?"

VIDYUSHEKHARA BHATTACHARYA

HINDI.

SHREE VAISHNAVA edited by Shree Jagannath Das, Bharatpore. To be had of the Manager of the "Shree Vaishnava", Ajmere. Annual subscription—Rs. 2.

This has now been started as the chief organ of the Vaishnavas and has taken the place of the "Vaidik Sarvasva." The issue under review consists of 29 pages and contains some thoughtful articles besides the usual pages devoted to the present Vaishnava organisation. The poem "Vinita Vinga" is nicely written and instructive. Each issue is priced at as. 5. The journal could have been priced a little less.

AROGYA AUR USKAI SADHAN by Mr. Lakshman Narayan Garde. Published by the Granthaparakashaka-Samiti, Behares City. Crown 8vo. pp. 82. Price—as. 0.

This is a translation of a book written by Mr. Gandhi in Gujarati, which has been much appreciated and has been translated in Marathi as well. The book embodies Mr. Gandhi's personal experiences about health and hygiene and has thus a speciality and attractiveness about it. Simple but most useful hints have been given on all the subjects which affect health. The book does not repeat the stereotyped rules of hygiene and is for that reason particularly fascinating. Mr. Gandhi has devoted careful attention to hygienic rules in his own way. The book will no doubt prove very useful. The style and get-up are good.

SOOM KAI GHAR DHUM by Pandita Rupnarayan Pandeya and published by the Hindi-Grantha-ratnakar office, Hirabagh, Bombay. Crown 8vo. pp. 35. Price as. 3.

This is based on a Bengali farce. A miser who is alive has been proved to be dead by the machinations of certain bullies in spite of his own protestations to the effect that he is alive. The way in which the plot for the purpose has been arranged is very skilful. There is much to laugh at in the book. At last the

miserly habits of the hero are removed and he is a reformed man.

BAL VIVAH KA AIK HRIDAYDRAVAN DRISHYA by Mr. Krishnalal Varma. Published by the Secretary of the Jain Swamimbara Conference at Darwaha, Distt. Yavatmahal, Surur. Crown 8vo. pp. 20. Price—as. 1, Rs. 5 for 100 copies.

The book has ended tragically in the untimely death of a promising young man on account of his early marriage. There is much in the book which will instruct the general public and a distribution of this pamphlet among them can do some real good.

SAYAJI CHARITAMRITA by Pandita Shreeram Sharma. Published by Bhagavaddatta Sharma, Karali Bagh, Baroda. Demy 8vo. pp. 179. Price—Rs. 1.

This is a comprehensive biography of the great Ruler of Baroda, Maharaja Gaekwar. All the aspects of his life have been carefully dealt with and no important feature of his memorable career is overlooked. Occasionally details have been given about the special institutions organised by the Gaekwar. The printing and get up of the book are very nice. A genealogical table of the Gaekwar family has been given and several blocks in the book increase its attractiveness.

UPVAS CHIKITSA by Babu Ramchandra Varma. Published by the Hindi Grantharatnakar office, Bombay. Crown 8vo. pp. 170. Price as. 14. Cloth bound Rs. 1-2-0.

All that could be said on the system of cure by means of fasting has been mentioned in this book and the writer has sought to prove the great efficacy of fasting. It has been suggested that medicines are after all not of much use. The subject has been thoroughly discussed. The book will no doubt be a very nice addition to the medicinal literature of Hindi. The theory propounded in it is not altogether unknown to Hindus, but such elaborate publications based on modern scientific investigations must be very welcome. The get-up of the book is very satisfactory.

M. S.

GUJARATI.

We have received three small books from the Broach Sanitary Association; one is a bulletin giving vital statistics, and the other two, pamphlets on Cholera, and Malarial Mosquitoes. They are written to enlighten people about Sanitary needs.

GRIHINI DHARM by Sankalchand Ranchhod Shah, printed at the Parmar Printing Press, Rajkot. Cloth bound, pp. 55. Price Rs. 0-6-0 (1916.)

The trite sayings about a woman's duty, every now and then paraded, fortified with Sanskrit verses, and expressions worn threadbare by now, find a place in this book; we trust it has pleased its author, if none else.

VAITAL PANCHAVASI, by Jagivan Dayalji Modi, printed at the Lohana Printing Press, Baroda. Thick cardboard, pp. 183. Price Rs. 1-3-0, (1916.)

Students of old Gujarati should feel very thankful to Mr. Modi for publishing this book. Till now it was thought, that old Gujarati possessed very little prose but this book helps to remove that impression. This compilation consists of two parts: verse and prose: both treat of the celebrated stories of vaital; the prose portion seems to have been written accord-

ing to the publisher somewhere after Samvat year 1699. It need not be said that it is written by a Jain. We are sure that the text and its modern Gujarati version would prove of use to philologists.

K. M. J.

MARATHI:

GITADHARMA OR RAHASYAKHANDAN by Mr. J. I. Kolhatkar, B.A., LL.B., Publisher: The Aryabhushan Press, Poona. Pages 248, Price Re. 1-8.

This is a fairly exhaustive attempt at refuting the interpretation placed on Gita by Mr. B. G. Tilak in his *Magnum Opus* in Marathi, the *Gitarahasya* the appearance of which on the literary stage of Marathi last year kicked up a lot of dust and irritated not a few readers of orthodox type to such an extent that a stream of criticism has been ceaselessly flowing since then both in the press and on the platform all over the Marathi-speaking country. The unprecedented, phenomenal as one would like to say, sale of Mr. Tilak's work is due more or less to several causes, the chief of which, it cannot be denied, is Mr. Tilak's unrivalled popularity and the high position he has occupied in the estimation of the public. But the excitement produced by his work has also an intrinsic reference to the doctrine enunciated and expounded by Mr. Tilak in his work, which has given a rude shock to the popular understanding about Mr. Tilak, who was hitherto looked on as a staunch and blind follower of orthodoxy, and when such a man came forward with an unflinching and unblushing heart to question the correctness of the traditional interpretations placed on Gita by commentators like Shankaracharya and others, orthodox Shastrees and Pundits as well as several graduates of the old way of thought naturally felt the shock as a bolt from the blue and they could not restrain their feeling while giving expression to their indignation chagrin and disappointment much in the same way in which Julius Caesar is said to have uttered his last words 'Et tu Brute!' when he saw his dear friend Brutus dealing the fatal blow to that renowned Roman Consul. The whole controversy which has caused such immense commotion when briefly put, turns on the question whether the Gita preaches Renunciation after attainment of 'knowledge' as Shankaracharya has interpreted it or whether it enjoins Karma Yoga, a life of activity in its restricted sense of disinterested work. Mr. Kolhatkar, the author of the work which forms the subject of this review, follows the line of thought which characterises the Pundit class entirely, and firmly holds the first view and with the whole orthodox world at his back boldly challenges the latter view which is championed by men like Sir Ramkrishna Bhandarkar and other scholars of the new type, and which is so forcibly and clearly voiced for the first time by Mr. Tilak in his work. Mr. Kolhatkar produces no other authority in support of his view excepting the lore of commentators and the inspira-

tion of his unnamed *Guru*. Indeed his confidence in the correctness of his own view based on tradition is so strong and unbounded that it has often overstepped all laws of controversy and set reason at naught. While arrogating to himself the correct knowledge of Vedānta Mr. Kolhatkar has in his overweening confidence denied even a fair modicum of it to his adversary, which is not just. It would be superfluous for the reviewer in a periodical to enter into the details of the discussion which has occupied hundreds of fairly large-sized pages of books written by controversialists. A reviewer can at best attempt to present a resume of such controversy and make a few suggestive remarks about the comparative merits and demerits of the two views placed before him. To my mind there is much of common ground, ground of agreement, between the two seemingly opposite views. Both Mr. Tilak and Mr. Kolhatkar agree in so far that it is knowledge of Self that makes for Salvation or Moksha. The difference comes in when Mr. Kolhatkar asserts that activity after the attainment of that knowledge is neither necessary nor significant. Mr. Tilak, on the other hand, is prepared to concede so far that a man after having attained that spiritual knowledge may not, if he chooses, interest himself in the activities of the world and his choice of an inactive life will surely not come in his way of attaining Moksha, but he would prefer a *Dnyani* to be actively engaged in some self-less work rather than waste the sweetness of life in the desert air of Renunciation, of wrapping himself in contemplation in complete indifference to the interests of the world in which he moves. So that the real question when reduced to such a small dimension is, as one writer has very aptly put it, one of preference, and one really wonders why there should be so much fuss made over such a simple question. Works like the *Gita* have as much a practical value as they have their metaphysical significance, and looking at the peculiar circumstances of India at present, the former, i.e., the practical or ethical value of *Gita* should appeal more to our people. The greatest need of India at present is that of men who look upon the teaching of the *Gita* in its practical light, rather than attach a mere metaphysical significance to that divine song. It is enough for us to see that while interpreting *Gita* in this light of practical use, no violence is done to the sentiment of the original author of the *Gita*. Within these limits modern commentators have as much right to interpret old works as commentators of old like Shankaracharya.

Though Mr. Kolhatkar has completely lost sight of this view in his controversy with Mr. Tilak and consequently his book is devoid of all living interest, still it has its own value inasmuch as his criticism is likely to prove useful in balancing one's judgment and strengthen one's confidence in the possibilities of the future achieved by means of strenuous and self-less disinterested work.

V. G. APTE.

NOTES

Patna University Bill.

WHAT PATNA UNIVERSITY IS
INTENDED TO DO.

In introducing the Patna University Bill Sir C. Sankaran Nair said that "as soon as the new province of Bihar and Orissa was constituted in 1912 it was recognised that in order to make it a self-contained province it was necessary to furnish it with two institutions in particular, viz., a High Court and a University." Previous to this the *Beharee* had written in the course of a leading article:—

We have always pointed out to the public as well as to the Government the absolute necessity of expediting the establishment of the Patna University and this we have done, not because we hate the province of Bengal from which we have separated ourselves, again, not because we dislike the present administration of the Calcutta University, but because we are anxious to make our province fully self-contained. The idea of our having a separate university has its origin in our King-Emperor when he announced the formation of the province of Behar as a separate entity; and thereafter later on when it was more distinctly announced by Lord Hardinge the surmises of the thoughtful people were that the Calcutta University would be the prototype of the proposed one. We had not then clamoured for a name which would be utterly incapable of exercising its controlling influence independent of the bureaucratic influence and to this day when we request our Government to establish the Patna University, we do so with the full knowledge that the University we shall get will be equipped with all the improvements that have made the Calcutta University so distinctly enviable in the eyes of the other Universities. We want a University which should be similar to the Calcutta University.

In the Imperial Legislative Council, when Sir C. Sankaran Nair had finished speaking, Mr. Krishna Sahai of Bihar rose to support the Patna University Bill and observed in the course of his speech: "The establishment of a separate University for Bihar and Orissa will make the province fully self-contained."

It is clear then that both Government and the people of Bihar intend and desire that the Patna University should make the province "self-contained" in education. The use of the expression "self-contained" by Sir Sankaran Nair, Mr. Krishna Sahai and the *Beharee* alike is rather a curious coincidence. The people also desire, as we

find it stated in the *Beharee*, that the new university should be similar to the Calcutta University.

What is "self-contained"?

The question is, will the Patna University, as it is going to be constituted, make Bihar and Orissa "self-contained"? Even the best and most lavishly endowed universities in the world do not teach all subjects. Cambridge and Oxford do not teach *all* the subjects in which the University of Birmingham, for example, specializes. Harvard does not excel in every one of the subjects in which Columbia excels. Nor are even powerful and prosperous independent countries "self-contained" as regards education. Previous to the war, there were German students in Great Britain and British students in Germany. Technology is certainly not as well taught in Great Britain as it is in Germany. Forestry is another subject in which Germany excels. As regards India, not to speak of any single province, the whole country is not self-contained in education. Government recognise the fact by closing the Imperial Services to all Indians who are graduates of Indian Universities only, and giving appointments in them to a very few who have graduated in foreign Universities.

So, though it is a legitimate ambition to wish to make a province self-contained in education, it is also certain that the Patna University cannot make Bihar and Orissa self-contained in any broad sense. But even in the narrow sense in which the existing Indian Universities have made five provinces self-contained, the Patna University will not make Bihar and Orissa self-contained. For neither from the speech of Sir C. Sankaran Nair, nor from the Patna University Bill itself, can anybody be encouraged to hope that this new University will have anything to do with teaching Medicine, Engineering, or Commerce. In another respect this new University will be glaringly deficient. At present there are collegiate classes in Bankipore and Cuttack for teaching women students up to the Intermediate standard of the Calcutta University. Among the University and

External Colleges which are mentioned in Sir Sankaran Nair's speech and the Bill as constituent parts of the University, we do not find these classes mentioned, nor is there any proposal contained anywhere for the establishment of a Women's College. Unlike Bombay and some other parts of the country, Bihar is a *purdah*-stricken province and even in *purda*-free Bombay people have felt the need of a separate college for women. So in Bihar the co-education of men and women is out of the question. But if there be not co-education there should be arrangements made for the separate higher education of women. At present there may be no demand for the higher education of women among the indigenous population of the province, and the demand among them even for the elementary education of girls may be small; but at least for the girls' schools of the province lady teachers will be required who have received higher education.

The cry of "Bihar for the Biharis" is very popular in Bihar. But how will the province get Bihari doctors, Bihari engineers and Bihari school mistresses in sufficient numbers unless there be a Medical College, an Engineering College and a Women's College as component parts of the Patna University?

It would be a narrow and illiberal policy for any college in any province to close its doors to students from any other province. But no medical or engineering college in any province of India is sufficiently large to admit all the students of the province who want to be admitted; and as a matter of fact every year they have to refuse admission to a considerable number of students. It cannot, therefore, be expected that any such professional college will be able to admit and train a sufficient number of Bihari and Oriya students.

SPECIAL NEEDS OF THE PROVINCE.

In no province of India, and certainly not in Bihar and Orissa, have the people been able to sufficiently exploit its material resources. Industrially the whole country is in a backward condition. For different provinces, the lines of industrial advance may be somewhat different. In the new province large coal-fields and other mineral-bearing areas have been included. What would be more appropriate and necessary than to have a college teaching mining

engineering, mineralogy, metallurgy and allied subjects? Again, there are extensive agricultural areas, producing rice, wheat, sugar-cane, indigo, &c. What is more necessary than to have a faculty of agriculture in the new university with a college devoted to the teaching of the subject? True, we have the college at Pusa. But it does not and will not form part of any university, and does not grant university degrees. There are large forest areas in Orissa and Chota Nagpur, making it extremely desirable to make the highest education in forestry available in the province. Lastly, Orissa has a long sea-coast. When the ancient maritime and mercantile history of Orissa is properly written by some Oriya scholar, the maritime and commercial enterprise and achievements of the province will be fully understood, and her present and future possibilities measured to some extent. If the Oriyas were sufficiently educated and had a government under popular control, they would certainly try to have some good harbours along their sea-shore. A progressive government ought certainly to make arrangements for teaching ship-building and navigation to the people of Orissa.

But the new University is not going to meet the special needs of the province. It will for the most part turn out pleaders and clerks, who are undoubtedly required; but was a new university needed for the purpose?

UNEQUAL FACILITIES FOR THE SUB-PROVINCES AND DISTRICTS.

The province of Bihar and Orissa consists of three sub-provinces with the attached Native states. Their area and population are:—

Sub-province	Area in sq. m.	Population
Bihar	42361	23752969
Orissa	41789	8928316
Chota Nagpur	27679	5754008

The district of Santhal Parganas geographically forms part of Chota-Nagpur, Manbhum geographically and linguistically forms part of Bengal, and a portion of Purna, too, forms part of Bengal. But all these tracts have been included in the administrative sub-province of Bihar, thereby making it appear larger and more populous than it is. Still Orissa contains more than one-third of the population of Bihar, and Chota Nagpur contains one-fourth of the population of Bihar. But Bihar will be served by 5

colleges, Orissa by one and Chota Nagpur by one. Among the Colleges to be entirely supported by Government, two are in Bihar, one is in Orissa (not so well-equipped as Patna College), and none in Chota Nagpur.

But it is when we look at the areas of the sub-provinces that their unequal educational facilities appear still more glaring. Bihar and Orissa are about equal in extent; and if the artificial appendages of Bihar are taken away, Orissa is a more extensive tract than Bihar. But Bihar is to have five times the educational facilities of Orissa. Chota Nagpur has two-thirds the area of Bihar and would appear larger still, if the Santhal Parganas were added to it. But Chota Nagpur is not to have even one-third of the educational facilities of Bihar. The greater part of Orissa consists of small Native States; as the ruling chiefs are mostly like small land-holders, and under the administrative control of the Commissioner of the Orissa Division, and cannot have separate universities or colleges of their own, we have naturally taken Orissa to mean the whole region denoted by that name, both "British" and "Indian."

In questions of educational facility area is an important consideration. For this reason in official educational reports one sometimes finds it stated that in such and such a province there is one school in every three square miles or in every six square miles. Institutions situated at a great distance from the students' home are not of any use to the majority of them, who are poor. Hence it is important to bear in mind that Government is going to provide in Orissa one college for an area of 41,789 square miles, and no State college in Chota Nagpur but only an aided Christian mission college, for an area of 27,679 square miles. The language of Bihar is not the language of Orissa, and it is but one of the principal languages of Chota Nagpur. It is, therefore, all the more necessary that each sub-province should be sufficiently provided with educational facilities within its own borders.

If we examine the facilities to be enjoyed by the different districts of the province, the number of colleges strike us as extremely inadequate. The five districts or rather towns, of Patna, Muzaffarpur, Bhagalpur, Cuttack and Hazaribagh, out of a total of twenty-one districts, are to

have colleges. At present Monghyr has a college, but it is to be abolished. In Bengal, with which the new province is still educationally connected, there are only about half a dozen districts, like Rangpur, Bogra, Faridpur, Dinajpur, etc., which have not got colleges. But active efforts are being made in Rangpur and Faridpur to start colleges and in a few years, it is to be hoped, that no district of Bengal will be without a college.

COLLEGIATE EDUCATION MADE STATIONARY !

The most astonishing feature of the Bill is that it practically makes university education stationary in the province. And this in a province of which Prof. Jadunath Sarkar, with his 17 years of service there, speaks in his presidential address at the Bihar Students' Conference as follows:—

"Bihar has been 50 years behind the other provinces in taking to English education, and must make more exertions than they to come to the front line and take her legitimate place in the march of national progress."

As we are concerned here only with university education, let us see how far behind some of the other provinces of India the new province lags. According to the Bill it is to have only seven colleges. With this figure and some others taken from the *Statistical Abstract for British India*, Vol. V, 1915, we have prepared the following table:—

Province.	Population.	Number of Colleges.
Bengal	45,483,077	51
Madras	41,405,404	39
Bombay	19,672,642	15
United Province	47,182,044	49
Punjab	19,974,956	19
Bihar & Orissa	34,490,184	7

With three-fourths of the population of Bengal the new province is to have less than one-seventh of the number of colleges in the latter. With more than three-fourths of the population of Madras it is to have less than one-fifth of the latter's number of colleges. With nearly double the population of Bombay and Punjab it is not to have even half the number of colleges each of them possesses. With nearly three-fourths of the population of the United Provinces it is to have one-seventh of its number of colleges.

"But," the reader may exclaim, "surely Bihar will have more colleges in the near future as years roll on!" No, if the Bill passes in its present form. For the Bill lays it down definitely that

(2) No educational institution shall be admitted as a college of the University, unless the following conditions are complied with, namely :—

(a) the college buildings are situate within one mile from the Senate House of the University.....

(3) No educational institution shall be admitted as an external college, unless the following conditions are complied with, namely :—

(a) the college buildings are situate in one of the following towns, namely :—Muzaffarpore, Bhagalpore, Cuttack, or Hazaribagh ;.....

It may be contended that in these five towns of Patna, Muzaffarpur, Bhagalpur, Cuttack and Hazaribagh, there may be more colleges in future. Yes, it is *possible*, but not very probable. We shall say why.

It will be conceded that in the new province Government are following a policy with regard to university education which is not more progressive than that followed in the rest of India. Therefore in Bihar Government may be expected not to encourage the establishment of colleges in larger numbers than elsewhere. Patna has and is to have three colleges. Its population is 136,153. No other town in India with a population nearly equal to it, has three or more than three colleges. In fact, the towns of Allahabad, Lahore, Lucknow, Madras, Bombay and Calcutta, which have more than three colleges each, are more populous than Patna. Though more populous than Patna, Ahmedabad, Amritsar, Benares, Cawnpore, and Karachi, have not got three colleges each. It is, therefore, not probable that Patna will be privileged to have more than the colleges it has, unless the Bill is changed or a more liberal policy followed.

As regards the other college towns in the Province, Bhagalpur is the most populous among them, and its population is 74,349. No town in British India with approximately this population has more than one college. In Bengal, which has more colleges than any other province of India, the only other town besides Calcutta which has more than one college is Dacca, which has a population of 108,551. It is not probable then that Bhagalpur or the less populous towns of Cuttack, Muzaffarpur, and Hazaribagh will have more colleges than one each.

It is a strange principle that the Bill has adopted, namely, that those towns which have colleges now may have more, but those which have not got any must not have even one! This is tantamount to saying, those who are sufficiently or in-

sufficiently fed may have more food, but those who are absolutely starving must not have any! It is almost an accident that some towns have colleges and others have not. Darbhanga is more populous than Cuttack, Muzaffarpur and Hazaribagh, and its Maharaja is sufficiently rich to maintain a college, nay, even a university. Gaya is more populous than Muzaffarpur and Hazaribagh. Why should it not then have a college? Chapra, Puri, Arrah, Bihar, Ranchi, Bettiah, Sasaram, Balasore, Purulia, Jamalpur, Hajipur and Bhadrak are more populous than Hazaribagh. Why should not they then have colleges, if they or some patrons of learning can find the money? In Bengal, not to speak of small towns like Uttarpara, Bankura, Barisal, Comilla, &c., which have colleges, the populous villages of Daulatpur and Hetampur have colleges. In fact, in connection with the location of colleges, the question of the populousness of a place need not arise at all. If a village be healthy and accessible and if the funds for maintaining a college be forthcoming, it would be more preferable to locate a college in or near a village than in or near a crowded town, though crowded towns also must have their educational facilities.

If the relative healthiness of the towns of the new province be considered, we shall find many which are more healthy than those in which there are colleges. In 1915 the annual death-rates per thousand of the five college towns were: Patna 23, Muzaffarpur 39.2, Bhagalpur 22.2, Cuttack 21.2, and Hazaribagh 20.5. Hazaribagh appears to be the healthiest. But there are towns which are healthier than Hazaribagh, and therefore healthier than the other four college towns. We will mention a few with their death-rates per mille in 1915: Deoghar 17.9, Giridih 15.9, Ranchi 14.8, Lohardaga 19.4, Purulia 14.1, &c. We have counted 44 towns with a lower death-rate than Muzaffarpur. It is not then on the ground of superior healthiness that it can have the superior privilege of having one or more colleges denied to many other towns.

Ranchi was once chosen by the Bengal Government to remove the Calcutta Presidency College to. Later it was proposed to start a model college there. But now this very healthy place is not considered worthy to have a college even in the distant future. Another healthy town, Puru-

lia, the healthiest in the province in 1915, has already expressed an earnest desire to have a college. The local organ, *Manbhumi*, wrote on July 10 last, in expectation of the visit of His Honour the Lieutenant-Governor to the town :—

In the whole province of Chotanagpur there is only one college and that is in Hazaribagh which is conducted by the Dublin University Mission. In Orissa there is a Government College, so also in Patna. Can not Chotanagpur rightly claim one for her? The students who pass from this district as well as from Singhbhum choose to go either to Calcutta or to Bankura except those who secure Government scholarship, as they are forced to join the colleges of the province of Bihar and Orissa. But when the Patna University will be opened and the schools of this Province will be affiliated to that University where will they go? They will either have to go to Cuttack or Patna, and we all know how our students are treated there. They are not allowed seats in the hostels attached to the colleges, consequently they have to manage for themselves in a place where they have no acquaintance. It is for these difficulties which beset our students that a Government College should be established at Purulia, which is centrally situated and unlike Hazaribagh having direct railway communication. Would not any one of our esteemed townsmen explain the situation to His Honour?

Nor can the difficulty of controlling and supervising colleges at a distance from the seat of the university be adduced as a ground for practically putting a stop to the establishment of more colleges. If colleges at Hazaribagh and Cuttack can be controlled from Patna, why should colleges in places which are nearer and more accessible be impossible to control? Of course, should it be thought at any time in future that there were more colleges than could be properly supervised and controlled, the remedy of founding one or more new universities could be applied at once. And it is an officially sanctioned and prescribed remedy. For one of the objects of the projected Dacca University is to reduce the number of students under the jurisdiction of the Calcutta University. And as regards the Patna University Bill, the last paragraph runs as follows :—

The constitution of the new University will enable the Province of Bihar and Orissa to obtain a University of its own, and will effect some reduction in the large number of students now under the jurisdiction of the University of Calcutta.

It is to be hoped no official apologist of the Bill will say that seven is the maximum number of colleges which one university can properly guide and control. But should such a absurd statement be made our reply would be : "The time has come

then to give Orissa and Chota Nagpur a separate university each." It is the express desire of His Majesty the King-Emperor that the light of knowledge should brighten the homes of his subjects in all parts of his Empire. No servant or servants of His Majesty ought to stand in the way of the fulfilment of this desire.

We do not say that Colleges can or must be founded all over the province at once. What we do say is that it should be made practicable for every district and every considerable town to have a College; and certainly it should not be made impossible for all but five towns to have a college. How have the districts of Gaya, Shahabad, Saran, Champaran, Darbhanga, Monghyr, Purnea, Sonthal Parganas, Balasore, Angul, Puri, Sambalpur, Ranchi, Palamau, Manbhumi, and Singhbhum offended, that they are to be by Act of the Governor-General in Council debarred from having colleges? What have the towns of Darbhanga, Gaya, Monghyr, Chapra, Puri, Arrah, Bihar, Ranchi, Dinapore, Bettiah, Sasaram, Balasore, Purulia, Jamalpur, Hajipur, Bhadrak, Madhubani, Mokamah, Kendrapara, Dumraon, Motihari, Purneah, Sahibganj, Sambalpur, Siwan, Jajpur, Deogarh, Buxar, Sheikhpura, Khagaria, Giridih, Katihar, Sitamarhi, &c., done to merit the punishment of being prevented from having colleges?

The Case of Monghyr.

In his introductory speech Sir Sankaran Nair said :—

The Committee had proposed the expenditure of very considerable sums for the improvement of most of the external colleges which will be admitted to the privileges of the University, but here also, owing to the financial stringency, it has been decided to proceed at once on the basis of the colleges as they exist at present.

The Committee were of opinion that the Diamond Jubilee College under private management was a small and weak institution, and the Government agreed with the committee that we would not be justified in spending the very considerable amount that would be required to equip and maintain it efficiently. It has not been therefore proposed to include it in the new university.

This means that most of the external colleges are in an unsatisfactory condition; but the Committee have allowed all except the Diamond Jubilee College at Monghyr to remain. If their weakness could be tolerated, why could not the weakness of the Monghyr College be tolerated? It may be the weakest college in the province; but

that is no reason why it should be destroyed. This Spartan principle of killing the weak does not commend itself to us. The teaching of Christ is to take particular care of the weak. Christian servants of the King-Emperor ought to follow that teaching. If Government cannot spend money for the improvement of the Monghyr College, why could not the leaders of Bihar, including those of Monghyr, be asked and given time to raise a definite amount to make it equal at least to the weakest among the colleges which have been allowed to remain?

We have spoken of the destruction of the college at Monghyr because according to section 11 of the Bill,

11. Notwithstanding anything in any other law for the time being in force, no University established by Act of the Governor-General-in-Council shall, after the commencement of this Act admit any college to any privileges whatever, and any privileges granted to any college prior to the commencement of this Act, shall be withdrawn on the commencement of this Act.

The Case of Patna.

Sir Sankaran Nair has said that in Patna "no colleges will be affiliated to the university which are not situated within one mile of the council house at Patna." In the Bill the words "Senate House of the University" are used instead of "Council House." We do not know whether the Council House is to be used also as the Senate House, or whether a Senate House is to be built hereafter. In any case, we are not sufficiently conversant with the topography of Patna to be able to say whether within one mile of the Council House there are sufficiently large, open and unoccupied plots for the foundation of colleges. We hope there is no magic in the words "within one mile of the Senate House." In this age of Motor cars and Telephones, perhaps two or four or ten miles would do as well. We know from Sir Sankaran Nair's speech that the Secretary of State had agreed to the establishment of two more colleges at Patna, but the idea had to be dropped owing to financial difficulties. But these financial difficulties may not be everlasting. Therefore there should be some provision in the Bill according to which it may be easy to establish these colleges at Patna when the financial stringency is over. And as the Secretary of State had sanctioned the establishment of a Mission college, the foundation of a Hindu or Sanskrit College and of an Islamic College

ought also to be provided for in the Bill. This is better than to have to pass in future a supplementary Bill for founding one or more colleges.

Self-Government and the Bill.

In reply to a question asked by Mr. B. N. Sarma in the Imperial Legislative Council Sir C. Sankaran Nair said that "the Government of India look forward to an extension of local Self-government, but have not laid down any definite scheme for introduction after the war."

Then again, in the important Circular to Local Governments, addressed by the Government of India on the relation of local bodies to educational institutions within their jurisdiction and on other educational matters, it is said :—

6. As stated above the attitude of the [Decentralisation] Commission regarding the control of education is on the same general lines in respect of all classes of local bodies. Their objects throughout is to give to such bodies a greater share in the control of such classes of education as are entrusted to their care and by so doing to enlist a greater degree of interest and enthusiasm in the educational administration under their charge. They recognised that the majority of educational officers consulted were of opinion that this policy would lead to loss of efficiency but they considered that this view should not prevail against the recognised public policy of educating the people in self-government, and they were further influenced by the consideration that primary education (with which local bodies were chiefly concerned) should be adapted to the needs of the people and that this could best be effected by securing for local bodies more direct responsibility for its evolution and management. This consideration is in accordance with the views already expressed by the Government of India and the Secretary of State and the policy which it represents may be accepted as the guiding principle which, as far as practical conditions permit, should regulate the relations of local bodies toward primary education.

In Sir C. Sankaran Nair's reply to Mr. B. N. Sarma "an extension of local self-government" is stated to be intended by Government. In the Circular quoted above "educating the people in self-government" is declared to be "the recognised public policy." We are, therefore, entitled to ask that this just, statesmanlike and liberal attitude towards self-government be maintained in the case of the Patna University Bill in particular and of University education in the country generally.

The Curzonian Universities Act of 1904 officialised the Universities to a far greater extent than was the case formerly. The Patna University Bill redresses popular

influence to a nullity and makes the official element supreme. So the new university is going to have a much worse constitution from the point of view of self-government than the existing ones. If the Bill is to pass in its present form, it would be better to make the university a department of the Bihar Government in name also as it is to be in reality. There is no beauty or utility in having two authorities in name while in reality there is only one.

We need not repeat our observations in our last issue on the constitution of the Patna University and on other matters relating thereto. The senate should be enlarged to a body of at least 100 members, of whom at least 60 should be elected. Its resolutions should be binding on the syndicate, which latter body should consist of a clear majority of members elected by the senate. The Vice-Chancellor should be an elected officer, as in the Benares Hindu University. He should not have more powers than the Vice-Chancellors of the existing universities. In the Bill he has been made too much of an autocrat and practically a whole-time paid officer of the Government. And it is difficult to see how a mere mortal man, as the Vice-Chancellor would most probably be, would be able to conscientiously and satisfactorily discharge all his duties, which are :—

(2) The Vice-Chancellor shall be the principal executive officer of the University, and shall, when present, preside at every meeting of the Syndicate or of any other University body (except in the Senate when the Chancellor is present) of which he is a member. (3) The Vice-Chancellor shall be charged with the due carrying out of the provisions of this Act and of the Regulations. (4) The Vice-Chancellor shall appoint and control all officers and servants of the University other than the University staff. (5) The Vice-Chancellor shall have the right of visiting and inspecting the external colleges. (6) The Vice-Chancellor shall decide finally all matters of discipline in the University, and such matters of discipline in the colleges of University as are not delegated to other authorities by the Regulations.

The Bill proposes to confer on the Chancellor certain powers which that officer does not enjoy in the other Indian universities.

Irresponsible power can seldom be exercised properly. Not only are checks necessary, but, as no man or body of men can be a repository of all wisdom, help in the shape of criticism, suggestion and advice is also needed. One may say, without possessing any knowledge of their working, that syndicates, as collections of erring mortals,

may sometimes go wrong; but concrete examples of the mistakes and even the perversity of such bodies would not be at all difficult to bring forward. They must therefore occasionally require the help of the senate. But the latter has been made only a deliberative body. It has been lost sight of that men do not deliberate with all their earnestness, intelligence and wisdom when they know that their deliberation would not practically influence the course of affairs. Earnest discussion in the senate, by the elected representatives of the public, of problems of high education, arouses interest in such questions among the people at large and is an effective means of educating them in the consideration of such matters. The public would lose this indirect but important advantage if the Bill passes in its present form.

What the Colleges would teach.

Regarding the standards up to which and the subjects which the university colleges and external colleges would teach Sir C. Sankaran Nair says :—

As to the courses of study it is intended that the University is to undertake the whole of the science teaching of the University colleges at Patna, law teaching and the Honours B. A. and the Post-graduate work in arts subjects. Provision is to be made for a system of intercollegiate lectures in the B. A. pass and so far as is possible in the junior classes at Patna, but the external colleges will teach in arts subjects only up to the Pass B. A. and to the intermediate science in science subjects. As exceptions to the above the Cuttack College will provide teaching for the Honours B. A. and the pass B. Sc., and the Bihar National College will provide teaching for the pass B. Sc. On this question also there was a difference of opinion among the members of the committee. It is, no doubt, possible to give Honours and Post-graduate instruction of some kind at various centres as is now done elsewhere and to so arrange the examinations that the students could pass them without any further or better training, but the majority of the members were of opinion that the higher branches of University study required the scientific co-operation of a number of the best teachers working under the best conditions and a considerable body of students with such natural capacity and so well equipped as to be fit to receive advanced instruction. As these conditions do not exist in the various other colleges nor are they likely to arise, it is believed, for many years to come, the Government have come to the conclusion that the external colleges should teach the various subjects only up to the B. A. pass standards and science subject only up to the standard required for the intermediate examination.

We emphatically and entirely dissent from the conclusion at which the Government have arrived. The power of colleges

to teach any subject up to a high standard is entirely a matter of resources in men and money. Let the university only fix the number and qualifications of the professors required and give an idea of the sort of laboratories and libraries necessary for teaching a subject up to a certain standard. If any college can satisfy these requirements, let it have the privilege of high teaching. It is absurd to take it for granted that only Patna would be found up to the mark. As the Government have so severely limited the number of colleges, it is their bounden duty to equip all these colleges properly, so that they may all be able to teach at least up to the Honours B. A. and Honours B. Sc. standards, which are after all not very high standards. What is the good of keeping these external colleges alive and continuing to call them colleges, if they are to be practically no better than glorified high schools?

Every well-informed educationist knows that even lower standards are taught better and in an inspiring manner, if a master mind does the teaching. The students of the first year class of a well-equipped first grade college may have the advantage of being taught by professors of great ability, but if a college is doomed to teach a subject only up to a low standard, it is but seldom that its students can come under the influence of very able professors. The inestimable advantage of freshmen coming under the influence of master minds is so well understood that at Cambridge and other leading universities many professors who have achieved distinction by original research lecture to freshmen.

Second and third grade colleges are, no doubt, better than no colleges at all. But where the number of colleges is so small, each college should be equipped as a first grade college. It may not be possible to do it now, but it can be done after the war. The present temporary financial stringency can never be a sufficient reason for permanently crippling the external colleges.

The province has an area of 83,181 square miles, that of England being 50,874 square miles. The population of Bihar-Orissa is 34,490,184, that of England being 34,045,290. In England the University of Oxford has 22 Colleges and 3 private Halls, and Cambridge has

17 Colleges and 1 Hall. Then there are the Universities of Durham, London, Victoria (Manchester), Birmingham, Liverpool, Leeds, and Sheffield. London University has 24 colleges giving instruction in 8 faculties. There are also University Colleges at Exeter, Reading, and Southampton. There are besides seven special Agricultural Colleges in 7 places in England. We do not forget that the new province is not England. But surely one or two colleges, for higher teaching (and that too not very high) are not sufficient to meet even the present demands of a province much more extensive than England and slightly more populous than the latter. Governments as well as peoples ought to have reasonable ideals and legitimate ambitions. We are sorry to find that the Government of India have set before themselves so low an ideal of its educational duties towards the new province.

Regulations.

The Bill lays it down that

(2) The first Regulations shall be framed by the Local Government. The Senate may, from time to time, make new or additional, or may amend or repeal the Regulations.

(3) The Syndicate shall have power to draft and propose to the Senate Regulations to be made by the Senate, and it shall be the duty of the Senate to consider the same.

(4) All new Regulations, or additions to the Regulations, or amendments to, or repeal of, the Regulations, shall require the previous sanction of the Local Government, which may after the opinion of the Syndicate has been taken sanction, disallow, or remit the same for further consideration.

From the character of the Bill it would be easy to guess the character of the Regulations to be framed by the Local Government, and, as official influence is sure to be supreme in the Senate and the Syndicate, the additions and amendments to them or the repeal of any of them is not likely to improve their character to any appreciable extent. Everything coming from an official source is not, of course, to be condemned. But at the same time the utter absence of popular control and criticism cannot be held to be desirable. It would be of some use if the Regulations to be framed by the Local Government were published for public criticism and suggestions.

It is not clear whether the new University will fill its colleges through the door

of the Matriculation or of the school final examination, or whether the Principals will be empowered to impose some other test or qualification on candidates for admission to their first year classes. This is a very important matter, and on it will depend the supply of undergraduates to the University. The popular view is, and it is a just and reasonable view, that the Education Department ought not to have any direct or indirect power to check the spread of high education such as school final examination, may be made to confer on it

Residential Colleges.

In the course of his introductory speech Sir C. Sankaran Nair said :—

The main feature of the scheme is that there should be a central residential and teaching University at Patna. This represents the form of University from which according to the present ideas the best educational results may be expected to follow. Some of the members of the Committee desired to have a University established which was entirely of this description, but the majority were of opinion that there were other considerations which precluded the establishment of such a University. There were several colleges in the province situated at a considerable distance from Patna at which students were being already educated for a University career and from which it was impossible to expect a complete migration of students to a Central University. It was accordingly decided that in addition to the university Colleges at Patna there should be a series of external colleges at various centres outside Patna itself. The Central University at Patna, therefore, and the external colleges are to be united so as to form a single University governed by common regulations and under the same general control.

It is a piece of good fortune that the University has not been made a centralised and purely residential one. Residential Universities and Colleges are more costly than non-residential ones, and therefore they are utterly unsuited to the requirements of an extremely poor country like India. If the Scottish Universities had been residential like Oxford and Cambridge, University education would not have been more widespread there than in England. When Sir C. Sankaran Nair observes that the central residential University "represents the form of University from which according to the present ideas the best educational results may be expected to follow," he merely repeats and echoes the prevailing Anglo-Indian bureaucratic idea, for which there is little justification to be found in the facts of recent

University development in Great Britain, not to speak of the continent of Europe. We are not blind to certain advantages of residential institutions. But if from residential universities alone, according to the latest and most authoritative opinions on the subject, "the best educational results may be expected to follow," how is it that in England, in none of the Universities founded after Oxford and Cambridge has there been an exact reproduction of the form or model of those mediaeval Universities? Englishmen are independent and self-governing. If the residential idea had been the best and most up-to-date they would not have departed or permitted any departure from that idea in any of the new Universities. For the best educational results the residential form is not essentially necessary; but it may be required by the bureaucracy to serve some political purpose of theirs. But that is a different matter altogether.

State Control of Universities.

This brings us to the question of State control of Universities. Anglo-Indian bureaucrats hold that university education in India must be subject to interference and absolute control by the State, if it is to be in any way "effective and efficient." In our opinion that is a wrong view. The following paragraph lends support to our opinion.

At the annual meeting of the University of London Graduates' Association on March 16, the president, Sir William Collins, said that the two cardinal vices of higher education in Germany were the identification of the University with the State by State-appointed and State-paid professors, and the bestowal of degrees by the professors on their own students without independent examination. This led to the worship of the State and a belief that it could do no wrong, and propagated this doctrine in the rising generation.

What is bad in and for Germany can not be good in and for India. May we not hope that British Statesmen and officials in India will not copy from an enemy country any harmful ideas and think that they can be good for the British Empire.

The Patna University Bill, a Menace.

We have written at some length on the Patna University Bill, as we think the educational interests of not only the Province of Bihar and Orissa but of the whole of India may be prejudicially affected by it.

For sometime past there has been a demand, on the part of official and non-official Anglo-Indians, as expressed in their organs, for legislation amending the Indian Universities Act of 1904 in such a way as to still further weaken the power of the non-official Indian element in the senate,—to make it, in fact, a quite impotent factor. The Patna University Bill gives the public some idea of such amending legislation. The bureaucratic method is to introduce retrograde measures first in provinces where public opinion is comparatively less pronounced than where it is more articulate. The Patna University Bill may therefore be taken as the thin end of the wedge. The cause of high education in India would suffer most seriously if the existing universities were fashioned after the model of the Patna University. The quality of high education might or might not, then, improve, but its spread would certainly be arrested.

It is, therefore, the urgent duty of the educated public all over India to discuss the Bill in all its aspects and bearings and to send representations on it to the Government of India.

The Duty of the Bihar, Orissa and Chota Nagpur Leaders.

As for the leaders of Bihar, Orissa and Chota Nagpur, their duty is to make their voice heard distinctly against all the retrograde and obstructive features of the Patna University scheme. They should print copies of the Bill and Sir C. Sankaran Nair's speech, and send them for opinion to such Indian Vice-Chancellors and ex-Vice-Chancellors as Dr. Sundar Lal, Dr. Devaprasad Sarvadhikary, Dr. Sir Pratul Chandra Chatterjee, Sir Gooroodas Banerji, Sir Narayan Chandavarkar, Sir Ashutosh Mukherji, &c., and to the Indian non-official members of syndicates, Indian Principals of unaided colleges and other Indian educationists. When these opinions are received, they should be summarised and forwarded to the Government.

As things are, Bihar is educationally in a very backward condition, Orissa is in a worse position than Bihar, and the condition of Chota Nagpur is the worst. And the Bill proposes to give fixity to this deplorable state of things. Public opinion and the press are not at all strong in Bihar, they are weaker in Orissa and al-

most non-existent in Chota Nagpur. It is all the more necessary, therefore, for the leading men of each of the three sub-provinces to do their part like men. And the weakness of the new province increases the responsibility of the older provinces. Duty towards brethren and self-interest alike require that they should exert themselves to the utmost.

An Educational Circular to Local Governments.

Replying to a question put by the Honourable Mr. Sastri, the Hon'ble Sir Sankaran Nair has made public an important educational circular of the Government of India. It is dated the 19th September, 1916. We have already quoted a paragraph from it in which it is declared to be the recognised public policy of the Government to educate the people in self-government. That declaration is in welcome contrast with the spirit of the Patna University Bill. The whole circular appears to breathe a different spirit, as a few examples will show.

It is proposed in paragraph 488 of the report of the Decentralisation commission that

Divisional "Commissioners should have the power to call for information from Inspectors of Schools, to express views, and to stop any action of the Education Department within their divisions which they consider undesirable. In paragraph 502 it is proposed that every Government college, secondary school, training and technical school should have a Board of Visitors of which the Commissioner, the Collector and the local Sub-Divisional Officer as well as non-officials should always be members, and that no new Government college, secondary school or training or technical school should be started and no alteration should be made in the status of an existing institution without the Commissioner and Collector being consulted. It is further proposed in paragraph 539 that the Collector should always be entitled to call for any information which he thinks fit from any officer of Education Department and to have such information given to him spontaneously in matters of importance.

"The replies of local Governments to show that Commissioners and District Magistrates can, under existing practice, already call for information from educational officers; that there are already facilities for consultation and that important educational schemes are not likely to be initiated without taking the views of executive officers. These arrangements appear to the Government of India to be satisfactory, but they would impress upon local Governments the extreme importance of the recommendations made by the Commission, the advantages of unofficial consultation between executive and educational officers, and the desirability of regarding the Inspector and the District Deputy Inspector as the

educational advisers of the Commissioner and District Magistrate respectively."

The circular then proceeds to observe that *At the same time the Government of India are opposed to any rigid rule whereby a Commissioner can stop action by the Department of Public Instruction as such a rule would tend to substitute official conflict for official co-operation; and by fostering official co-operation it would be possible to render any such procedure superfluous.*

The circular also enlarges the powers of local bodies in respect of primary education.

In their dealings with primary education the Commission would vest local bodies with very considerable latitude in such matters as the provision of buildings, the hours of attendance, the grant of holidays and of prizes, the levy of fees and the disbursement of grants-in-aid. In most parts of India local bodies are already in possession of fairly wide powers in these respects and where this is not the case the Government of India agrees that efforts should be made to evoke the interest of local bodies in primary school administration by the withdrawal wherever reasonably feasible, of such restrictions on their action in respect of the above-mentioned matters as may be at present imposed by local rules or educational codes. As regards the educational establishments the same principle should be observed as that accepted by the Government of India in their resolution of 28th April 1915 on local self-government policy in respect of local establishments generally, namely, that while such matters as have acting and travelling allowances, pensions or provident funds and maximum salaries should be governed by rules prescribed by the local Government, the local bodies should have a free hand in the creation and filling up of appointments and in the punishment and dismissal of the occupants. Similar discretion should be allowed (as is already the case in most areas) in respect of the opening and closing of schools, but it should be understood that the Collector should have power to order the opening of new primary schools where he considers this to be necessary and it will be open to local Governments to require if they so wish, that the closing of a school should be subject to the sanction of the Collector or the Director of Public Instruction.

CURRICULA IN PRIMARY SCHOOLS.

8. The Commission further recommend the exercise by local bodies of a somewhat similar discretion as regards the adoption of curricula in primary schools. The present practice is for the local Government on the advice of the Department of Public Instruction to prescribe the curriculum, and it is understood that a certain measure of choice of subjects is sometimes permitted. The Government of India desire to see this latter practice emphasised and made more general. Course of various kinds may be prescribed by the Department of Public Instruction and the adoption of them with or without any alterations (subject

to the intervention of the Collector in cases where considerations other than educational may be involved) may be left entirely to the local bodies. Text-books which are not approved by the Education Department should not be prescribed without the sanction of the Collector but a free choice should be given for the selection of text books from lists of approved works adopted by the Department, care being taken to prevent too frequent and unnecessary changes.

Biharis and Bengalis in Bihar.

The progress of every province depends on the cordial co-operation of the different sections of its inhabitants, so long as sections exist; and we have no doubt the spirit of co-operation will ultimately prevail everywhere. From this point of view it is a matter of sincere satisfaction to note that that able and public-spirited citizen, Rai Bahadur Purnendu Narayan Sinha, has been returned to the provincial council by a Bihar constituency. Equally satisfactory is the choice of the Bihari students of the distinguished teacher and historian Professor Jadunath Sarkar to preside over their last conference held at Darbhanga. We should have been better pleased if we had not to speak of such occurrences as noteworthy, as they ought to come about quite as a matter of course.

Prof. Jadunath Sarkar's "Practical" address.

Professor Jadunath Sarkar calls his presidential address at the Bihari Students' Conference "severely practical." Practical it is, not in the sense of wanting in idealism, but in the sense of showing the way to the realisation of some ideals. The first lesson which students should learn from his address is that they should remain students even when their academic career is over and they "have ceased to prepare for any examination." Prof. Sarkar considers himself a student still. His observations in connection with social service by students should be borne in mind by "leaders," demagogues and journalists.

In this connection, I deprecate the prevailing custom of appealing to the students as if they were the saviours of society and must act as drudges at every work of social utility. Social service of the type I shall describe later, is allowable in a student, and is indeed necessary for the completion of his education; but it should normally be restricted to his leisure hours and should not be out of proportion to his period of necessary toil for school or college.

Regarding the social service which stu-

dents may render without any interference with their proper duties, the professor observes :—

There is one way in which every student can help the expansion of education and thereby repay his debt to the community.....Every young man should during the long vacation privately teach the three R's to ten of his neighbours and thus help to diminish the appalling mass of illiteracy in the country. The cost in primers and slates will work out at 1½ annas per pupil. No great sacrifice is required on the part of the teacher ; all that we need is the spirit of social service in the workers and organisation on the part of the leaders. I, therefore, propose for your consideration that in every town and large village there should be a small local committee, which would enrol the names of volunteer teachers during holidays, supply them with books and slates and furnish reports of their work, showing the number of teachers, pupils and days of actual work, and the cost. Such statistics should be laid before our Conference and printed in its report. The Central Committee should subsidise the work by bearing half its cost, the other half being raised locally.

Our students may also utilise their holidays to spread light in their villages, by talking on sanitation and other useful matters, and keep small stores of medicine for distribution among the poor in cases of emergency or epidemic. Organisation on these lines will yield the happiest results at a small cost.

There is another matter in which our students can influence society and set a very effective example. They can take a vow never to attend a dance by professional women, or a play in which actresses of the disreputable class take part. If this is done, then in a few years, when the young men of to-day will have become the heads of their households, they will refuse to allow *nautches* at any ceremony in their families, and social purity will be easily effected.

In Prof. Sarkar's opinion,

Our supreme need to-day is the modernisation of Bihar,—casting off the methods, habits, thoughts and practices of the declining days of the Mughal empire and Nawabi rule, and adapting ourselves to the modern world, modern methods, modern ideas, and above all, the modern spirit,—that modern spirit, which feels a divine discontent with things as they are, and restlessly seeks to make them better,—that modern spirit which is not satisfied with second-hand information, but tries to penetrate to the very roots of objective truth, by experimenting, analysing, and looking at everything in the focus of light concentrated on it from all directions.

The paragraph which immediately follows the above extract has been taken by some journalists to mean that Prof. Sarkar condemns the endeavour to gradually make the vernaculars the vehicles of instruction in all grades of educational institutions :—

The English language is the key to this modern knowledge, and English literature is the surest medium for acquiring this modern spirit. Judging from the actual growth of our vernaculars as they stand to-day, it will be many years before a fairly high modern education can be imparted *solely* through the medium of our mother-tongue. We must

be taught and examined in a foreign and painfully acquired language. It is an abnormal phenomenon, it is an unpleasant fact ; but it is a fact, and we must face it in our generation, though our children may probably be better off in this respect in their days.

But we do not see any such condemnation here. He rather looks forward to the day when the normal method of instruction through the vernaculars will replace the present "abnormal phenomenon." Moreover, we have not forgotten his article on the Teaching of History in a previous number of this REVIEW, in which he described how he used the vernacular of Bihar to teach history to his students in Patna College. And he says in another part of this very address that Bihar can be modernised "only by imparting modern knowledge, *through the Vernaculars or English.*"

He administers a well-merited rebuke to the "reactionaries, of pretended orthodoxy."

I fail to understand the pessimistic cry that has been raised by some of our elders, "Enough of English education." All the ills of our country are due to it. Replace it by the indigenous teaching of our ancestors." The reactionaries who say so, call themselves lovers of orthodox Hinduism. I am myself a Hindu and I have studied ancient Hindu literature and history. I can say that true Hinduism never shrank from truth of any kind ; true Hinduism produced the universities of Takshashila and Nalanda and the schools of Mithila and Benares. These opponents of English education do not want to go back to the free and fearless quest of truth which marked the period of Hindu greatness, but to the superstitions and slackness of the 18th century, when the Mughal civilisation had lost its vital force and society was sunk in darkness corruption and lethargy. These old women of modern India want to issue an edict like the late Dowager Empress of China, ordering the people to "return to the learning of Confucius," i.e. to be again what they were in 2000 B.C. No greater calamity than this can befall Bihar or the Hindu community.

These reactionaries of pretended orthodoxy are only playing the game of the insidious enemies of India's progress who cry, "Cheap education is nasty and worse than illiteracy." To-day it is needless for me to refute this theory. Every European country has made primary education free and compulsory.

He then examines the question whether college education is necessarily bad when it is cheap.

Take the case of Scotland. Only a hundred years ago, many a poor Scotch student used to go to the Edinburgh University from his village home carrying a sack of oatmeal on his back, hire a small bedroom, keep the sack in one corner of it, and live on the oatmeal. Here was education as cheap as could be imagined. Thomas Carlyle, when a boy of 14, had to walk a hundred miles alone on foot to his university and live there in the same humble style. To-day, no doubt, this "discipline of poverty and self-

denial," as Froude calls it in his "Life of Carlyle," is not so austere; but, thanks to the Carnegie endowment, no Scotch student has now to pay his fees. Is Scottish education, then, nasty because it is cheap? Are Scottish graduates worthless because their entire college expenses do not come up to the price of "the latest flannel checks" of the young aristocrats of Oxford and Cambridge? On this point I shall not presume to say anything of my own, but simply quote a very recent pronouncement of Sir Harry H. Johnston, a distinguished colonial governor, explorer and statesman: "[The present British] politicians, therefore, saddled with the inadequate education I have characterised, acted like the fox in the fable who had lost his tail; they were desirous that we should all be tailless. They, therefore, saw to it that all the avenues to public education were controlled by their contemporaries at Oxford or Cambridge. In short, to such [men] the world-teaching of Oxford was the Ark of the Covenant, just as an education at Eton or Harrow was supposed to make a better officer on the field of battle, a more upright and intelligent minister of state than the education at a Scottish, a Midland or a Welsh University." He then shows how very prejudiced such a view is. English philosophy and the English public services bear witness to the efficiency of cheap Scottish education. When we look around ourselves we find Scotchmen filling the places of all the bankers, jute mill managers and assistants, and marine engineers in India. If these are the deadly fruits of the tree of cheap knowledge as it grows in Scotland, let the tree be transplanted to India by all means; we are ready to risk our lives by eating such fruits.

The professor concludes his address to the students with an inspiring call to idealism.

I have hitherto spoken to you in a practical spirit. But that does not mean that I despise ideals. On the contrary I hold that we shall all be the better for choosing and pursuing a particular ideal for our individual selves, for vowing to live "the life dedicated" as Lord Haldane called it in his Rectorial Address. The outer world may seem hostile to us; our circumstances and environment may be discouraging; but, no true heart will falter for that reason. The ideal will ever be before our mind's eye, though it may be lost to our material vision now and then. To such the noble lines of Matthew Arnold about the scholar-gipsy will ring true:

"Why faintest thou? I wander'd till I died.
Roam on! The light we sought is shining still.
Dost thou ask proof? Our tree yet crowns the hill,
Our Scholar travels yet the loved hill-side, ..
Still nursing the unconquerable hope,
Still clutching the inviolable shade."

The possession of "prohibited" or "seditious" literature made penal.

In our "Notes" in the last number we quoted a paragraph on "seditious literature" from the Bengal Police Administration Report for 1915 and observed that it "seems to foreshadow, at least to seek to prove the need of, further repressive legislation." We also ob-

served: "The law of sedition in India is such that classical works and others of undoubted authority and value may be brought under it; and the possession of these may be made penal under the new law indirectly demanded. And if there be an official demand, there will be an official supply."

What we anticipated has come to pass not in the shape of a new Act but in the form of a notification under the Defence of India Act, as the following telegram from Simla published in the dailies will show:

The Government of India have issued a notification under the Defence of India Act prohibiting the possession of documents containing any words, signs or visible representations which instigate or are indirectly (a) the use of criminal force against His Majesty or the Government established by law in British India or against public servants generally or any class of the public or any public servant, or (b) the commission or abetment of anything which is an offence against Sections 121-A, 122, 131, 435 and 436 of the Indian Penal Code, or of the offence of robbery or dacoity or anything which is an offence under the Indian Arms Act 1878, the Explosive Substances Act 1908 or Section 27 of the Indian Army Act 1911. No person shall knowingly have in his possession or under his control any prohibited documents in such circumstances as afford reasonable grounds for believing that he is about to publish or circulate such document, and whoever contravenes the provision of this rule shall, unless he can prove that he had such documents in his possession or under his control for a lawful object, be punishable with imprisonment which may extend to three years and shall also be liable to fine. No Court shall take cognisance of any contravention of this Rule save on complaint made by an order, or under an authority from the Governor-General-in-Council, the Local Government or some officer empowered by the Governor-General-in-Council in this behalf.

Our opinion that even classical works may be considered seditious according to the Indian law of sedition finds support from the following prophetic words of Lord Morley:

Let us look at it as practical men who have got to deal with the government of the country. Supposing you abolish freedom of the Press, or suppress it, that will not end the business; you will have to shut up schools and colleges, for what would be the use of suppressing newspapers if you do not shut the schools and colleges? Nor will that be all. You will have to stop the printing of unlicensed books. The possession of a copy of Milton or Burke or Macaulay, or of Bright's speeches, and all that flashing array of writers and orators who are the glory of our grand and noble English tongue, the possession of one of these under the peculiar and unfair notions of Government will be like the possession of a bomb, and we shall have to direct the passing of an Explosives Books Act. All this and its various sequels and complements make a policy, if you please; but after such a policy had produced a mute, sullen, muzzled, lifeless India, we could hardly call it, as we do now, the

brightest jewel that ever sparkled in an Imperial Crown. No English Parliament would permit such a thing, and the last man to acquiesce in such a policy is Lord Minto, the Governor-General of India.

"The Mecca Revolt."

The Review of Reviews writes :—

THE MECCA REVOLT.

It is quite evident from the Indian press that the Mecca revolt has not commended itself to the Indian Muslims. They say that the holy places of Islam must be held by a strong Muslim Power capable of defending them against any non-Muslim attack. Since the Sheriff who has headed the revolt is not strong enough to maintain his independence, they consider that his action has placed the safety and sanctity of Mecca and Medina in jeopardy. Resolutions to this effect have been passed at meetings convened in Lahore, Lucknow and Calcutta, and Muslim organs like *The Mussalman* of Calcutta have expressed themselves in sympathy with them. *The Statesman* of Calcutta and other Anglo-Indian journals are seeking to discount these views by saying that the agitators represent nobody; but such a man as the Raja of Mahmudabad, who represents the Muslim community of the United Provinces of Agra and Oudh in the Supreme Legislative Council, cannot be so described.

In the present state of affairs it is very difficult to ascertain the true Moslem feeling in the country.

"Impatient" Internationalism.

The following cutting from a Japanese paper will be read with interest:

COLOURS OF THE NATIONS BURNED IN NEW YORK.

Unfurling Banner of International Industrialism.

New York, June 1.—An American flag and the Colours of many other nations were burned to-night in a "melting pot" in the yard of the Rev. Bouck White's Church of the Social Revolution. The "ceremony" was conducted by Albert Henkel, introduced as "an artist." After the Colours had been destroyed, Henkel unfurled the banner of "international industrialism."

The flag burning was preceded by services in the church, at which one of the speakers was the Rev. Mercer Green Johnston, who recently resigned as rector of Trinity Protestant Episcopal Church at Newark, N. J., because, he said, some of his vestrymen wanted him to run his church "like a grocery store."

After the church services White announced the congregation would adjourn to the yard and "witness the birth of internationalism."

After a speaker had declared, no moment could be "more auspicious for the merging of all nations into international commonwealth," Heinrich Weber, who spoke in German, renounced the flag of his fatherland and cast it into the flames.

Weber was followed by natives of Great Britain, Russia, Japan, Italy, Sweden, Roumania and Greece, who cast the Colours of their countries into the "melting pot." Then Henkel cast the American flag into the fire.

The "Pan-Turanian" Movement.

A Special Correspondent of the Central News Agency states:—

For some years a new movement has been noticeable in Turkey, known as "Yeni-Turan"—New Turan. Its object is to revive Turkish nationality at the expense of the Moslem religion, and on this basis to unite in a general federation all the Turco-Tartar and kindred races, Bulgarians included. Its promoters are hostile to Islam, on the ground that (so they say) Islam tends to destroy the feeling of nationality, and has prevented the formation of a "Turkish" civilisation: they want to "make the Turkish national soul independent of Islam." Islam in fact, has no place in their programme unless some fragments of it, much modified, are to survive in the new Turkish "national" religion.

The movement has both a literary and a political side. The former seeks, among other things, to glorify the history of the Turanian races: Ghengiz Khan is made a hero and a statesman by those who dream of restoring his empire. The political side concerns the Arab race. Bitter hostility is shown to them. They are a "misfortune" for Turkey; they must be Turkish; their "khands" must become Turkish colonies, their history and customs must be forgotten; above all, their language must be forbidden and replaced by Turkish. All this has been constantly advocated by Turkish nationalist writers, and a Turk preaching in Syria has declared that the existence of the Prophet was a fiction invented by the Arabs.

Yeni-Turan is worked by a society, subvented by the State, known as "The Turkish Hearth"; and behind it are the Committee of Union and Progress, whose leading men are not Moslems in any sense and who, as a Government, have been denounced by Moslems for many acts contrary to the Sheriat.

The movement is, of course, warmly encouraged by Turkey's German task-masters. Since Germany discovered that it was impossible to seduce from their allegiance the great Moslem populations embraced in the Empires of France and Britain, her enthusiasm for Islam has cooled remarkably; while the world now knows (thanks to the capture by the famous circular addressed by the German Government to its colonial agents) that all the time Germany was seeking to destroy the Moslem religion in her late African colonies. Germany, in fact, is to Islam the most dangerous of all enemies, the enemy who poses as a friend.

Information supplied by a news agency is at all times liable to be coloured and vitiated by the political bias of the agency or by the political influence and pressure to which the agency or its correspondent is subjected. This is particularly the case in these days of international strife and hatred. Hence it is not certain to what extent the above description of the Pan-Turanian Movement is correct, or whether there is such a movement at all. All that can be said that such a reaction against Arabian influence must come in some period or other of a Moslem nation possessed of vitality.

There is an element in human genius which is common to all races. Hence the religion and culture of one race may be imbibed by another. But there is also an element of individuality in the genius of each race which distinguishes it from that of other races. The Christianity of all Christian races has the same Semitic origin. But the vigorous individuality of many western races has enabled them to divest their Christianity of what was peculiarly Semitic in it. As for the civilisations of countries like England, France, Germany, &c., they are not derived from Palestine, but largely from Greece and Rome, and moulded by the national genius of the peoples inhabiting those countries. In Moslem countries, Arabian religion and culture still hold supreme sway, though, of course, in actual life an Indian Musalman's beliefs and practices are not identical with those of a Chinese Musalman. There are, no doubt, exceptions, as for example, the Sufis of Persia. Sufism is not Arabian in spirit. Still Musalman nations have less national individuality than Christian Nations.

National movements rest on a firm belief in the fact that on the whole every country was, is, or can be equal to any other country in all essential expressions of the human spirit. For this reason an Indian Nationalist in the widest and truest sense, while not rejecting any truth from any quarter and while advocating world-wide exchange and interdependence in all spheres of human thought and activity, cannot be content to remain forever in spiritual, intellectual, political, industrial, or any other kind of bondage to any nation, ancient or modern. We Indians must justify our possession of a soul, of mind and heart and bodily powers and skill, by expressing ourselves in religion, in art, in science, in philosophy, in literature, in political institutions, in social customs, and various other ways.

If there has been a Pan-Turanian Movement in Turkey, it must be because the Turks or some of them have found that they have souls possessed of individuality distinct from those of the ancient and modern Arabs, and they want their souls to find unfettered expression in all ways.

Rise of Wages in America.

Aynes C. Laut writes in *Maclean's Magazine* that in America

Wages have risen automatically 10 per cent. for unskilled labour all over the country; and skilled labour is commanding prices that seem almost incredible. In some of the munition factories men are earning on piece-work £6 to £8 a day. That is—the workman is in many cases earning as much in a month as he formerly earned in a year. He is earning as much in a month as a foreman, or book-keeper, or teacher, or preacher, earns in a year.

In India, a *mistri* of any sort earning from Rs. 90 to Rs. 120 *per diem* is unimaginable.

Conditions of Legitimacy in Government.

Guizot, in his *Lectures on Civilisation in Europe*, thus describes the conditions of legitimacy in Government:—

"The conditions of legitimacy are the same for the government of a religious society as for that of any other; they may be reduced to two: The first, that the power should attach itself to and remain constantly in the hands of the best and most capable, as far, at least, as human imperfection will allow of its doing so; that the truly superior people who exist dispersed among the society should be sought for there, brought to light, and called upon to unfold the social law, and to exercise power: the second, that the powers legitimately constituted, should respect the legitimate liberties of those over whom it exercises itself. In these two conditions, a good system of forming and organising power, and a good system of guarantees of liberty, consists the worth of government in general, whether religious or civil; all governments ought to be judged according to this criterion."

Royalty the Sovereignty of Right.

The French thinker and historian pursues a similar line of thought in another lecture, where he dwells on that aspect of royalty which is "the personification of the sovereignty of right."

"Royalty is quite a distinct thing from the will of a man, although it presents itself in that form; it is the personification of the sovereignty of right, of that will, essentially reasonable, enlightened, just, and impartial, foreign and superior to all individual wills, and which in virtue of this title, has a right to govern them. Such is the meaning of royalty in the minds of nations, such the motive for their adhesion. Conceive to yourselves the smallest assembly of men, I will not say a people: conceive that assembly under submission to a sovereign who is only so *de facto*, under a force which has no right except that of force, which governs neither according to reason, justice, nor truth; human nature revolts at such a supposition,—it must have right to believe in. It is the supremacy of right which it seeks, that is the only power to which man consents to submit. What is history but the demonstration of this universal fact? What are the greater portions of the struggles which take place in the life of nations, but an ardent effort towards the sovereignty of right, so that they may place themselves under its empire? And not only nations but philosophers believe in its existence and incessantly seek it. What are all the systems of political philosophy, but the

search for the sovereign of right? I affirm, and the interest common sense will acknowledge, that the sovereign of right completely and permanently can appertain to no one; that all attribution of the sovereignty of right to any human power whatsoever, is radically false and dangerous. Hence arises the necessity for the limitation of all powers, whatever their names or forms may be; hence the radical illegitimacy of all absolute powers, whether its origin be from conquest, inheritance, or election..... This principle being laid down, it is no less certain that royalty, in whatever system it is considered, presents itself as a personification of the sovereign of right. Listen to the theocratical system: it will tell you that kings are the images of God upon earth; it is only saying that they are the personification of sovereign justice, truth and goodness. Address yourself to the juris-consults; they will tell you that the king is the living law; that is to say, the king is the personification of the sovereign of right, of the just law, which has the right of governing society. Ask royalty itself, in the system of pure monarchy; it will tell you that it is the personification of the State, of the general interest. In whatever alliance and in whatever situation you consider it, you will always find it summing itself up in the pretension of representing and reproducing the sovereign of right, alone capable of legitimately governing society. There is no occasion for astonishment in all this. What are the characteristics of the sovereign of right, the characteristics derivable from his very nature? In the first place he is unique; since there is but one truth, one justice, there can be but one sovereign of right. He is permanent, always the same; truth never changes. He is placed in a superior situation, a stranger to all the vicissitudes and changes of this world; his part in the world is, as it were, that of a spectator and judge. Well! It is royalty which externally reproduces, under the most simple form, that which appears its most faithful image, these national and natural characteristics of the sovereign of right."—Guizot, *Civilisation in Europe*, Ninth Lecture.

Lincoln on the Paramount Political Purposes of Government.

Having defined the paramount political power of government, Lincoln also defined the paramount political purposes of government in his first message to Congress, delivered July 4, 1861. Mark his words:

"This is essentially a people's contest... It is a struggle for maintaining in the world that form and substance of government *"whose leading object is to elevate the condition of men—to lift artificial weights from the shoulders; to clear the paths of laudable pursuits for all; to afford to all the unfettered start and a fair chance in the race of life."*

This is also the English theory of the State, namely, that the state exists for the people. In fact in England the state and the people are practically identical. Though in India that is not yet, still there is no

insuperable difficulty in the way of the state here conforming entirely to the ideal of English theorists and of Lincoln, in opposition to the doctrine promulgated by the German writer Treitschke that the state is greater than the people and the people exist for the state. The English theory is coming to be recognised in India, too, though very very slowly.

Bankura Sammilani Famine Relief Fund closed.

The Bankura Sammilani Famine Relief Fund is now closed. What further help may have to be rendered, will be given from the balance in the Treasurer's hand. We tender our sincere and respectful thanks to all the generous donors who have enabled us to relieve the distress of hundreds of famine-stricken men, women and children.

Helping the Filipinos to self-government.

The Philippine Islands came under American rule about 18 years ago. The whole of the archipelago is now under civil government. The central government is composed of the Governor-General, who is the chief executive and president of the Philippine Commission, and eight Commissioners (three Americans and five Filipinos). The Philippine Commission constitutes the upper house and the *elective* Philippine Assembly the lower house, of the legislative body. The members of the Assembly hold office for four years, and the Legislature elects two Resident Commissioners to the United States, who hold office for the same term. Those are members of the United States House of Representatives, with a voice, but not a vote.

The islands are divided into 36 provinces of which 31 are regular and the rest special. The government of each of the regular provinces is vested in a provincial board composed of a governor and two vocals. The governor is the chief executive of the province and presiding officer of the board. *He and the vocals of the board are all elected by popular vote*, just as if our provincial governors and lieutenant governors and their executive councillors were elected by our votes. The government of towns is practically autonomous, the officials being elected by the qualified voters of the municipalities and serving for four years. For other details of the advanced state of self-government in the Philippines the readers may consult our notes and

articles in previous numbers and the chapter on the Philippines in Mr. Lajpat Rai's book on the United States of America.

The Jones Bill introduced in the United States legislature proposed to confer complete independence on the Filipinos not later than four years from the passing of the bill. On the wide-reaching effects of the measure, as the Filipinos hoped it would be passed, the Hon'ble Rafael Palma writes in the *Philippine Review* :

The independence of the Filipinos under the conditions proposed in the Jones Bill represents a notable progress, the scope and results of which in the sphere of international politics may not even be understood or appreciated to-day in the United States. It signifies not only an act of reparation, an abandonment of the imperialist doctrine which constitutes the profession of faith of the great powers, but also the adoption of a new dogma that implies the renunciation of acquired rights, where these rights are not founded upon morality and justice. It signifies, moreover, the noble and loyal fulfillment of all the engagements implied in the voluntary acceptance of a trusteeship for the Filipinos, and the inauguration of a new method for the peaceful and legal solution of the question of one people's dependence upon another. It furthermore signifies the reaffirmation of the principle enounced in the Declaration of Independence, that peoples should always be governed by their own consent, never without their consent.

The Jones Bill has not been passed in the form in which it was originally drafted ; but even in the form in which it has become law, of which we are going to give the reader some idea, it would greatly help forward the Filipinos on the road to complete self-government and ultimate independence ; and for this reason the Americans are entitled to a large part of the credit which is implied in Señor Palma's observations quoted above.

The *Springfield Republican* says that it is a fact of importance to Americans that the Filipinos seem to be satisfied with the passage of the Philippine Government Bill for the "contentment of a people with their government is one of the final and conclusive tests of the character of that government." Then, briefly summarizing the bill this journal notes that

in place of the present Philippine Commission, which is abolished, the Filipinos are to elect a Senate. The House is already elected by the people, and, with the election of the Senate, the electorate is to be increased by about 600,000. As about 200,000 Filipinos vote now the new law will grant voting rights to about 800,000. The office of Governor-General is retained and there is to be a vice-governor, an American, whose duties are to be fixed by the Governor-General. The functions of the legislature are limited so as to provide that the coinage, currency, and immigration

laws shall not be made without the approval of the President of the United States. Finally, all Americans residing in the Islands who desire to vote must become citizens of the Islands. The *Republican* points out also that the preamble of the bill fixes no specific date for the granting of independence, but simply states "that it has always been the purpose of the people of the United States to withdraw their sovereignty over the Philippine Islands and to recognize their independence as soon as a suitable Government can be established therein." Therefore, enlarged powers of self-government are granted "in order that by the use and exercise of popular franchise and governmental powers, they may the better be prepared fully to assume the responsibilities and enjoy all the privileges of complete independence."

The enactment of this law has furnished the occasion for Mr. Manuel Quezon, Commissioner of the Philippine Islands, expressing himself as follows in a statement which he has issued to the press :

"He flies in the face of history who ignores the fact that no people ever stop or even hesitate in the middle of the road once they begin to struggle for their liberty. Every advance made is an encouragement to take further and faster steps."

"Beginning from to-day we shall use this legislation to remind the American people that they have promised us independence, and when the government provided for in the act is established we shall run that government in a way that will show the world that we are in fact a nation, capable of fulfilling our obligations to ourselves and other peoples, and fully competent to live an independent life. We are bent upon convincing the American people within the next year or two that a stable government can be established in the Islands. Then having fulfilled the condition imposed, independence will be forthcoming."

. United Provinces Conferences.

Recently the United Provinces of Agra and Oudh have given proofs of much civil vitality and activity. Not only were there held last month political, social and industrial conferences in those provinces, but, as Mr. C. Y. Chintamani stated in his able, informing and lengthy presidential address at the political conference at Jhansi,

No fewer than four special provincial conferences have been held between the last and the present sessions of our regular annual Conferences—the memorable Conference of the 30th May, 1915, held to protest against the House of Lords' action in regard to the constitution of an Executive Council in these provinces, the Municipal Bill Conference held at Cawnpore, the Educational conference held at Lucknow, and, last in point of time but not the least in importance, the Hindu Conference at Benares. Our grievances remain unredressed and we are alive to the necessity of continued effort, but we may claim without immodesty that the United Provinces can no longer be looked down upon as a sleepy hollow and that, however slow-footed the Government may be, the

exponents of Indian opinion at any rate have fairly awakened to a sense of their public duties

Regarding the future position of India in the Empire Mr. Chintamani said :—

I associate myself wholly and entirely with my esteemed friend the Hon. Mr. V. S. Srinivasa Sastri in an observation he recently made, that we will put up with much suffering before we shall accept the domination of the colonies over us, and I feel sure that in saying this I am expressing the unanimous opinion and feeling of all members and every member of this Conference. It is to be hoped that the Government of India will lose no time in informing His Majesty's Government of this keen feeling of India.

Mr. Chintamani did well to dwell on the deplorable state of education in the U. P., the most deplorable among the major provinces, and to criticise the restrictive policy pursued, in the paragraph quoted below.

In the face of such a situation, which is no credit to anybody concerned and which is a public peril, is it not incredible that a restrictive policy should be pursued in the blameless name of Efficiency, a word which seems to bring much comfort to the mind of the official educational reformer, as the more doubtful word Prestige stands for so much in Indian politics generally? No one of us is an advocate of worthless education, this is only a convenient assumption of officialdom to belittle the value of our criticism of its policy. As our Conference has declared year after year it is our conviction that in the present state of the country and of these provinces, the governing principle of educational policy should be the wider diffusion of education, and efficiency should be secured to the greatest extent compatible with such diffusion. Insist upon elementary board schools if you think that the agency of aided private schools must be discarded, but do not discourage the latter unless and until you open an adequate number of the former. Carry out your policy of restricting the size of classes, but do so only to the extent that the number of schools and colleges allows of your giving effect to it without turning into the street large and increasing numbers of young men who may become desperate in the absence of facilities for education and of sympathy. See by all means that students do not breathe an unwholesome political atmosphere, and bring them up in proper discipline, but do not deprive them or their teachers of legitimate freedom, do not follow a policy of suspicion of all and sundry, and do not think that wisdom lies in substituting departmentalism for popular control in increasing measure. Give our young men better education most certainly—we shall bless you for that—but educate all our young men—an increasing number of them as year succeeds year—and to this end, adopt a policy of freely encouraging and liberally assisting private effort to supplement the resources and activities of the state. And pray cease to treat the department of public instruction as the Cinderella of departments. There are several other departments on which you may practise economy when you are in that mood or under that necessity, not only without detriment to the public weal but with great advantage. If, for instance, you spend a little less on your C.I.D., you will find to your agreeable surprise that you will hear less of

that 'unrest' which apparently gets so much on your nerves. Trust the people, educate the people, be just to the people, and you will be free from all anxiety and your C.I.D. will find its occupation gone.

These words should be pondered over not by U. P. officials alone, but by the bureaucracy all over India; for the educational policy is everywhere the same.

The full meaning and implication of the words, "a situation, which is no credit to anybody concerned," should be properly understood. If the Government have not done their duty to the best of their ability, neither have the people who possess education and means.

Conferences in Bombay.

Bombay has also recently held some conferences. Over the political conference, the Hon. Mr. M. A. Jinnah presided. In the course of his masterly presidential address, he said :—

Is it possible or natural as a rule for members of Parliament to grasp or grapple with questions affecting the internal administration and progress of India? When it was found that that was not possible in the case of Australia, Canada and South Africa, with few millions of population, would it not be miraculous if they continued to manage successfully the affairs of India by Parliament sitting in London? Having regard to the rapidly growing wants and demands of the people and the tremendous progress and changes that India is going through every few years, is it possible to govern India from Whitehall, or Downing Street? To those who know India and understand India, it is clear that she no longer will merely obey, but wants to manage her own affairs. Peace, prosperity and security which satisfied her a decade ago are no longer enough. The Soul of Young India has been roused and it yearns for Political Freedom. However well our physical and material wants may be provided for, that is not sufficient, India wants to raise herself to a status which will command the respect of the Nations of the World for her and which will be befitting her National honour and self-respect. It is not now a question of a few posts; it is no longer a question of a few grievances or reform of internal matters of administration, it is a question of complete change of policy. The question at issue is not merely of details but it relates to the fundamental structure of the Government and we require a statesman to deal with the present situation and re-fashion and re-construct the constitutional form of the Government of India. It is said that there is dissatisfaction in the Country; it is said a Political agitation is kept up which is embarrassing to the Government; it is said that the Home Rule League movement is not desirable; but what is the cause of it all? Surely, those are not merely the signs of an excessive imagination as explained by some people for want of better knowledge. It is quite clear that this is due to the awakened political consciousness of the people, who demand a new polity and resent—and rightly resent—

sion or application of the principle of separate communal electorates to municipalities, district boards or other local bodies.'

But in spite of what appears to us to be a defect in his masterly address, it was a very weighty pronouncement, lucid, reasonable and convincing because of the note of sincere conviction which rang through it. His scheme of provincial autonomy, apart from its intrinsic merit, gains in authority from the fact that it is the constructive demand of an able lawyer, legislator and leader, the president of the first United Bombay Provincial Conference, and the President-elect of the ensuing session of the All-India Moslem League.

The "New India" Cases.

The High Court of Madras has not been able to give any redress to Mrs. Annie Besant in the matter of the forfeiture of the *New India* security. In the other case in which the legal power of the Magistrate to demand security from her was called in question, two of the three judges have expressed the opinion that the Magistrate has acted *ultra vires*, but all the same they have pronounced the opinion that they have no power to undo what the Magistrate has done. Mrs. Annie Besant may have redress by bringing a civil suit against the Magistrate; and that she says she will do.

The Chief Justice of Madras has in the course of his judgment said that the keeping of printing presses and the publication of newspapers in India are extremely hazardous. So they are. Even if Mrs. Besant had won both her cases, it would not have shown that the Press Act of 1910 was not a very stringent and repressive measure. For not many editors have the financial and intellectual resources of Mrs. Besant to be able to fight in the way she has been doing; nor are all of them cast in the heroic mould. Her defeat makes the case against the Press Act stronger. And the divergency in the judgments of the three judges as regards the particular articles in *New India* which have and which have not offended against the Act, shows the extreme uncertainty of the scope of its principal section. If three trained lawyers who are judges of the High Court, can differ so widely, what are we poor editors to do? As things are, our existence depends entirely on the forbearance of the executive. That is a very precarious and

produce good-will, concord, harmony and co-operation :-

There is but one question besides the question of cow-killing and street music which has proved not only a thorny question but an obstacle which kept the two communities hitherto apart. But the solution is not difficult. It requires a true spirit of conciliation and give and take. The Mahomedans want proper, adequate and effective representation in the Council Chambers of the country and in the District and Municipal Boards, a claim which no right minded Hindu disputes for a moment. But the Mahomedans further require that representation in the various boards and Council Chambers should be secured to them by means of separate electorates.

This question of separate electorates has been before the country since 1909, and rightly or wrongly the Mussalman community is absolutely determined for the present to insist upon separate electorates. To most of us the question is no more open to further discussion or argument as it has become a mandate of the community. As far as I understand the demand for separate electorate is not a matter of policy but a matter of necessity, to the Mahomedans who require to be roused from the coma and torpor into which they had fallen so long. Differences in details such as method of securing to Mahomedans their adequate share in the Council Chambers, Municipal and District Boards should not be allowed to create an "impasse" and one side or the other must give in. I would, therefore, appeal to my Hindu friends to be generous and liberal and welcome and encourage other activities of Mahomedans even if it involves some sacrifice in this matter of separate electorates.

The "true spirit of conciliation and give and take" does not appeal to the Hindus alone to *give in*. No Mahomedan leader, so far as we remember, has ever said in what respects, even in provinces or places where the Musalmans are in a majority, they are prepared to be conciliatory and to "give in." Both in matter and manner Mr. Jinnah's views are not such as would promote harmony.

In 1910 Mr. Jinnah's political outlook was perhaps more widely national than now. For in that year he moved at the Allahabad session of the Indian National Congress :

That this Congress strongly deprecates the exten-

humiliating position. The Government of a country cannot be progressive, nor can the people advance, so long as the press is subject to such uncertain and humiliating restrictions. The Press Act should be repealed, and the law of sedition should be altered and liberalised, and brought into harmony with the view that nothing is seditious which does not directly or indirectly foster disloyalty to the sovereign and to the British connection.

Mrs. Annie Besant has rendered signal service to the cause of liberty in general and of liberty of the press in particular by bringing her grievances before the High Court. Her intellectual powers, forensic ability and courage cannot but extort admiration. Her determination to appeal to the Privy Council shows that she will leave nothing undone to make it a fight to the finish. It cannot be a normal state of things which requires anybody to spend so much money and energy and make such sacrifices merely to obtain justice.

One indirect good result of the case relating to forfeiture of the *New India* security, has been the declaration of the Madras Government through their Advocate General that they are not opposed to the propaganda of Home Rule, so long as it is conducted in a proper way. A similar declaration was made by the Bombay Government when Mr. Tilak was made to show cause why he should not be bound down to be of good behaviour. But the difficulty is to find out what in the opinion of the executive would be the proper way. To thoroughly convince the people that Home Rule is wanted and that Home Rule would be better than the present form of administration, concrete illustrations must be given. The danger lies in giving these illustrations. There are officials who are not prepared to admit that what they do can be productive of bad results. There are some others who may allow editors to point out the evil consequences of laws, regulations, ordinances, executive orders, &c. But there are perhaps no bureaucrats who will admit that any of them can have any bad motive in any of their official acts or measures. They draw the line there. They will not allow any ascription of bad motives. But does official position raise men's natures to such a high level that they become incapable of acting from bad or unjustifiable motives? Or are official motives inscrutable?

Public Spirit in the Provinces.

Madras, we believe, is the only province which has regularly held district conferences, and provincial conferences, too, as a matter of course. For some time past it has been ringing with the Home Rule cry. Home Rule literature is also being circulated there widely. In previous notes we have spoken of conferences held in the Bombay Presidency and in the U. P. Home Rule lectures are also being delivered in the Deccan. Mr. Sastri has been delivering Home Rule lectures in the U. P. One wonders what is wrong with Bengal. There is no political activity in this province. Social and Industrial Conferences have not been held here for many a year. There is some social service in the province, no doubt. But that is not a special feature of Bengal. It exists elsewhere, too, and in the Bombay Presidency, judged from this distance, it seems better organised than here. Women's education is a thing to laugh at in Bengal. As Bengalis we should like very much to know in what kind of public activity Bengal is equal to the most advanced of the other provinces.

Can it be said that Bengal is so immersed in the deeper things of life that no surface activity is apparent? We do not know. Is earnestness growing among us? It is difficult to say.

The Non-official Councillor's Memorandum on Post-war Reforms.

The Memorandum presented to the Government of India by nineteen elected non-official members of the Imperial Legislative Council is a very important document. It has been signed by members representative of the lauded aristocracy, who are ordinarily called by Anglo-Indians the "natural leaders of the people," by those who represent the educated middle class and the professions, by Musalman representatives and those who represent Indian commerce. The signatories have taken time by the forelock and have thus shown commendable zeal for the public good. Differences of opinion there must be as regards details. But the essence of the demand for self-government cannot but be endorsed by the whole of this big India. Some of us want more than what the honorable members have asked for, but certainly we cannot be satisfied with anything less.

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, *lawyers* are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. "It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

Baroda Administration Report.

It is always a pleasure to read the Baroda Administration Report. It is so neatly printed and well got-up in every respect, and clearly written without any mental reservation or concealment that one likes to keep it and study it at leisure with profit. In the volume for 1914-1915, Mr. V. P. Madhava Rao, the Dewan of the State, has given an exhaustive account of all departments of the administration and all forms of the activity of the Baroda Government. Considering that the population of Baroda is only 20,32,798, which is exceeded by many Bengal districts, the many-sided activities of the state embrace-

ing all spheres of the life of the inhabitants of Baroda, cannot but excite wonder. There is no British district which has to do so many things with only its own internal resources to fall back upon; and yet Baroda does well all, that is done in British districts, and in addition does well many things which are not attempted in many or most of them. Baroda has its Palace, its Army, its Legislature, its Judiciary, its Police, its Prisons, its Court of Wards, its Religious and Charitable Institutions as a State department, its Finance department, its Revenue and Settlement department, its well-developed Local Self-government scheme, its Industries (including Agriculture, Co-operative Societies, Factories, Forests, &c.), its Public Works department (dealing with buildings, roads, bridges, electric installations, state gardens, irrigation, water-works, drainage, forest works, state furniture works, railways, and Baroda city improvement trust), its Education department (dealing with all kinds and stages of education, ordinary and technical, for both sexes and all castes of the population, and providing the state with a Museum and numerous libraries), its department for Medical Relief, Sanitation and Vital Statistics (under which are a Lunatic asylum, a Leper asylum, a Maternity ward, Bacteriological, chemical and other laboratories, Ambulance, arrangements for Meteorological observations, etc.), &c.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:

The ways of some Anglo-Indian journalists are extremely laughable. When Babu Surendranath Banerjee, in the capacity of secretary to the Indian Association, sent a representation to the Bengal Government on the question of internments, these men said that he was not a representative man, as he had not been returned to the Imperial Council! And now these same journalists say that the nineteen gentlemen who have signed the memorandum represent only themselves, although they have been elected to the council by their constituencies! Who then, is a representative, please? Obviously he who echoes the opinions of these journalists. The great offence of some of these gentlemen is that they are lawyers. But what is a legislative council? An assembly, we suppose, whose main business is to make laws. Perhaps in the opinion of Anglo-India, lawyers are the least fitted to make laws. And as for such matters as the constitution, the work of administration, &c., lawyers can never understand them. For that reason the British nation have placed at the head of its affairs Mr. Asquith, a lawyer. They have even perpetrated the absurdity of making Mr. Lloyd George, another lawyer, their War Minister; and wonder of wonders! he is doing his work well too.

And as for the representative character of lawyers, it is well known that they do not at all belong to India, they drop from the planet Jupiter to attend law-courts on each day during which these tribunals remain open; and they attend council meetings also from their homes in Jupiter.

"The practical working of the separation of the executive and judicial functions was explained in the report of last year and there has been no change in the system during the year." The Conciliators are one of the most interesting institutions in the State. They have been doing good and useful work.

The members of the Baroda Legislative Council are given the right of interpellation, moving resolutions and requesting permission for the introduction of Bills.

"It is interesting to note that one of these Bills was a new Draft for the Infant Marriage Prevention Act wherein it was proposed to raise the marriageable age for boys to 18 years and to repeal the provisions relating to the granting of permission to perform infant marriages. The proposal of such a bill by an elected member is a significant testimony to the wide spread and increasing interest shown in social progress among the masses."

The number of religious and charitable institutions under direct Government management was 44:
